Introduction to FeynRules

Claude Duhr

The 2012 FeynRules/MadGraph school on LHC
phenomenology
Natal, 30/09-05/10 2012

Going Beyond SM

Going Beyond SM

New Physics is
supposed to show up
here.

Going Beyond SM

- A BSM model can be defined via
 - ➔ The particles appearing in the model.
 - ➔ The values of the parameters ('Benchmark point').
 - ➔ The interactions among the particles, usually dictated by some symmetry group, and quantified in the Lagrangian of the model.
- All this information needs to be implemented into the MC codes, usually in the form of text files that contain the definitions of the particles, the parameters and the vertices.

Going Beyond SM

- This can be a very tedious exercise.
- Most of these codes have only a very limited amount of models implemented by default (\sim SM and MSSM).
- However, still these codes do not work at the level of Lagrangians, but need explicit vertices.
- The process of implementing Feynman rules can be particularly tedious and painstaking:
 - ➔ Each code has its own conventions (signs, factors of i , ...).
 - ➔ Vertices need to be implemented one at the time.
- Most codes can only handle a limited amount of color and / or Lorentz structures (\sim SM and MSSM)

Going Beyond SM

- The aim of these lectures is to present a code that automatizes all these steps, and allows to implement the model into MadGraph 5 starting directly from the Lagrangian.
- Workflow:
 - ➔ Define your particles and parameters.
 - ➔ Enter your Lagrangian.
 - ➔ Let the code compute the Feynman rules.
 - ➔ Output all the information in the format required by your favorite MC code.

Plan of the Lecture

- What is FeynRules?
- Getting started:
 - ➔ ϕ^4 theory.
 - ➔ Adding gauge interactions (scalar QCD).
 - ➔ Adding mixings.
- Extending existing implementations.
- Towards LHC phenomenology: The UFO interface.

N.B.: Tutorials in the afternoon!

What is FeynRules?

FeynRules

- FeynRules is a *Mathematica* package that allows to derive Feynman rules from a Lagrangian.

[Christensen, Degrande, CD, Fuks]

- The only requirements on the Lagrangian are:
 - ➔ All indices need to be contracted (Lorentz and gauge invariance).
 - ➔ Locality.
 - ➔ Supported field types: spin 0, 1/2, 1, 2 & ghosts.

FeynRules

- FeynRules comes with a set of interfaces, that allow to export the Feynman rules to various matrix element generators.
- Interfaces coming with current public version
 - ➔ CalcHep / CompHep
 - ➔ FeynArts / FormCalc
 - ➔ MadGraph
 - ➔ Sherpa
 - ➔ Whizard / Omega

FeynRules

- FeynRules comes with a set of interfaces, that allow to export the Feynman rules to various matrix element generators.
- Interfaces coming with current public version
 - ➔ CalcHep / CompHep
 - ➔ FeynArts / FormCalc
 - ➔ MadGraph
 - ➔ Sherpa
 - ➔ Whizard / Omega

FeynRules

- The input requested from the user is twofold.

- **The Model File:**

Definitions of particles and parameters (e.g., a quark)

F[1] ==

```
{ClassName      -> q,  
 SelfConjugate -> False,  
 Indices        -> {Index[Colour]},  
 Mass           -> {MQ, 200},  
 Width         -> {WQ, 5} }
```

- **The Lagrangian:**

$$\mathcal{L} = -\frac{1}{4} G_{\mu\nu}^a G_a^{\mu\nu} + i\bar{q} \gamma^\mu D_\mu q - M_q \bar{q} q$$

L =

```
-1/4 FS[G,mu,nu,a] FS[G,mu,nu,a]  
+ I qbar.Ga[mu].DC[q,mu]  
- MQ qbar.q
```

FeynRules

- Once this information has been provided, FeynRules can be used to compute the Feynman rules for the model:

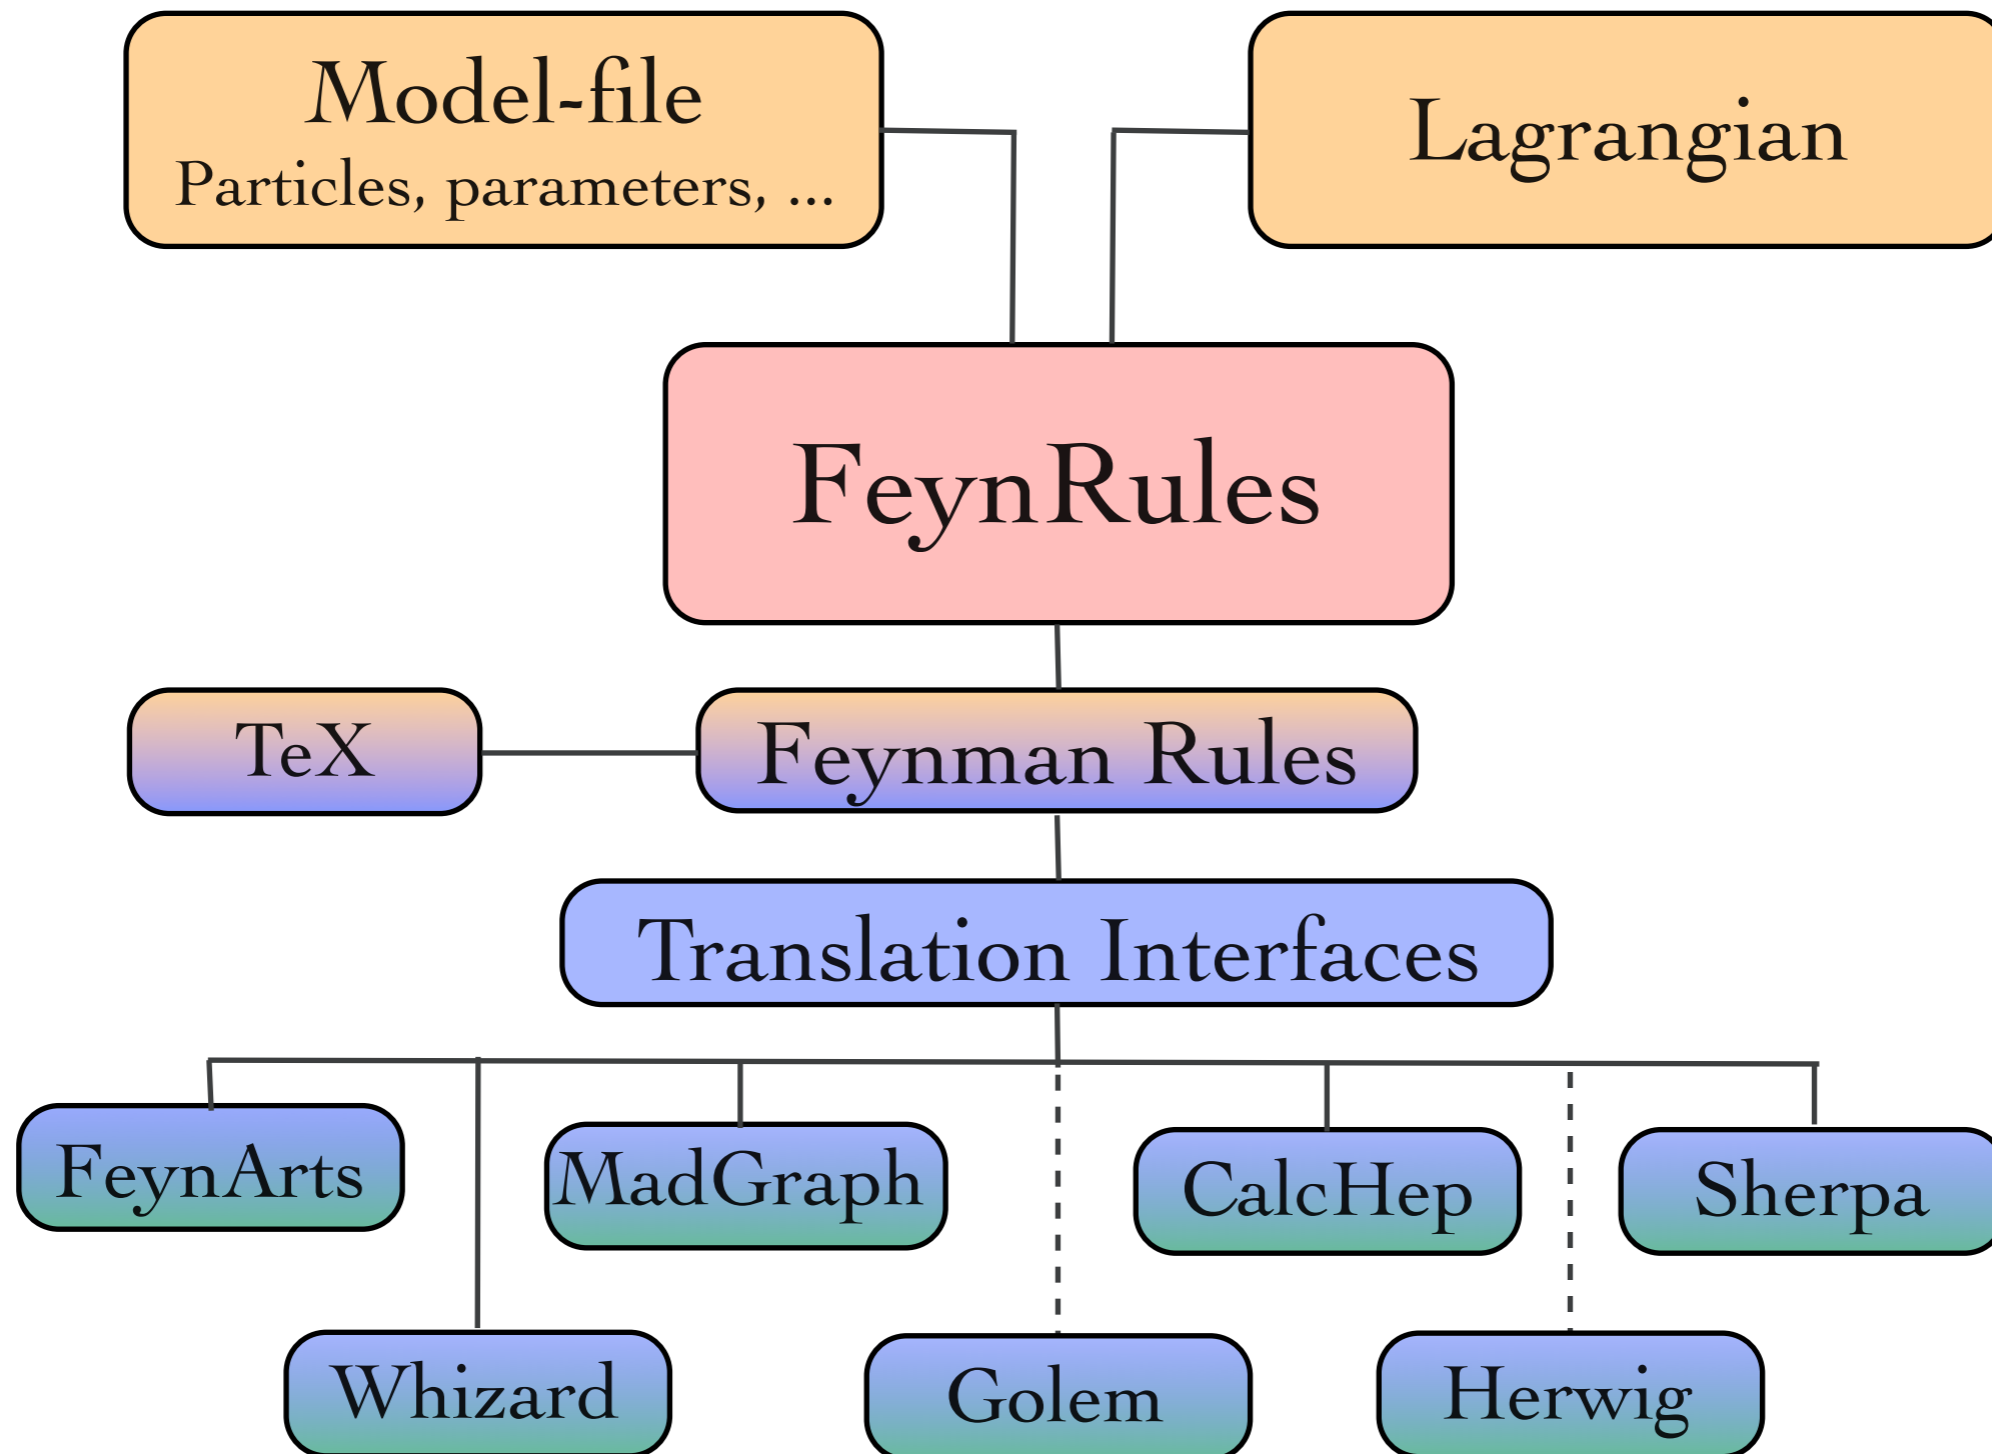

`FeynmanRules[L]`

- Equivalently, we can export the Feynman rules to a matrix element generator, e.g., for MadGraph 5,

`WriteUFO[L]`

- This produces a set of files that can be directly used in the matrix element generator (“plug ‘n’ play”).

FeynRules: a quick overview

Getting Started: phi4 theory

Phi 4 theory

- Let us consider a model consisting of two complex scalar fields, interacting with each other:

$$\mathcal{L} = \partial_\mu \phi_i^\dagger \partial^\mu \phi_i - m^2 \phi_i^\dagger \phi_i + \lambda (\phi_i^\dagger \phi_i)^2$$

- We need to implement into a FeynRules model file
 - ➔ The two fields ϕ_1 and ϕ_2 , or rather one field carrying an index.
 - ➔ The two new parameters m and λ .
- In a second step, we need to implement the Lagrangian into Mathematica.

How to write a model file

- A model file is simply a text file (with extension *.fr*).
- The syntax is *Mathematica*.
- General structure:

Preamble

(Author info, model info, index definitions, ...)

Particle Declarations

(Particle class definitions, spins, quantum numbers, ...)

Parameter Declarations

(Numerical Values, ...)

Preamble of the model file

- The preamble allows to ‘personalize’ the model file, and define all the indices that are carried by the fields
 - ➔ In our case we have one index, taking the values 1 or 2.

```
M$ModelName = "Phi_4_Theory";
```

```
M$Information = {Authors -> {"C. Duhr"},  
                 Version -> "1.0",  
                 Date -> "09. 09. 2011"};
```

```
IndexRange[ Index[Scalar] ] = Range[2];  
IndexStyle[ Scalar, i];
```

Preamble of the model file

- Sometimes it is useful to introduce auxiliary indices to obtain compact Lagrangians, but these indices should always be expanded.
 - ➔ **Example:** Weak isospin indices.
- There is a way to instruct FeynRules at run time to expand certain indices (see later).

```
IndexRange[ Index[Scalar] ] = Range[2];  
IndexStyle[ Scalar, i];
```

Preamble of the model file

- Sometimes it is useful to introduce auxiliary indices to obtain compact Lagrangians, but these indices should always be expanded.
 - ➔ **Example:** Weak isospin indices.
- There is a way to instruct FeynRules at run time to expand certain indices (see later).
- In addition, one can specify in the model file if a certain type of indices should **always** be expanded:

```
IndexRange[ Index[Scalar] ] = Range[2];  
IndexStyle[ Scalar, i];
```

Preamble of the model file

- Sometimes it is useful to introduce auxiliary indices to obtain compact Lagrangians, but these indices should always be expanded.
 - ➔ **Example:** Weak isospin indices.
- There is a way to instruct FeynRules at run time to expand certain indices (see later).
- In addition, one can specify in the model file if a certain type of indices should **always** be expanded:

```
IndexRange[ Index[Scalar] ] = Unfold[ Range[2] ];  
IndexStyle[ Scalar, i];
```

Particle Declaration

- Particles are defined as 'classes', grouping together particles with similar quantum numbers, but different masses (~multiplet).

```
M$ClassesDescription = {  
  S[1] == {  
    ClassName -> phi,  
    ClassMembers -> {phi1,phi2},  
    SelfConjugate -> False,  
    Indices -> {Index[Scalar]},  
    FlavorIndex -> Scalar,  
    Mass -> {MS, 100}  
  }  
};
```

Particle Declaration

- Particles are defined as 'classes', grouping together particles with similar quantum numbers, but different masses (~multiplet).

```
M$ClassesDescription = {  
  S[1] == { Spin (S, F, V, U, T)  
    ClassName -> phi,  
    ClassMembers -> {phi1,phi2},  
    SelfConjugate -> False,  
    Indices -> {Index[Scalar]},  
    FlavorIndex -> Scalar,  
    Mass -> {MS, 100}  
  }  
};
```

Particle Declaration

- Particles are defined as 'classes', grouping together particles with similar quantum numbers, but different masses (~multiplet).

```
M$ClassesDescription = {
```

```
  S[1] == {
```

```
    ClassName -> phi,
```

```
    ClassMembers -> {phi1,phi2},
```

```
    SelfConjugate -> False,
```

```
    Indices -> {Index[Scalar]},
```

```
    FlavorIndex -> Scalar,
```

```
    Mass -> {MS, 100}
```

```
  }
```

```
};
```

Symbol used for the
particle in the Lagrangian.

Antiparticle called
phibar.

Particle Declaration

- Particles are defined as 'classes', grouping together particles with similar quantum numbers, but different masses (~multiplet).

```
M$ClassesDescription = {  
  S[1] == {  
    ClassName -> phi,  
    ClassMembers -> {phi1,phi2},  
    SelfConjugate -> False,  
    Indices -> {Index[Scalar]},  
    FlavorIndex -> Scalar,  
    Mass -> {MS, 100}  
  }  
};
```

The field is complex, i.e.,
there is an antiparticle.

Particle Declaration

- Particles are defined as 'classes', grouping together particles with similar quantum numbers, but different masses (~multiplet).

```
M$ClassesDescription = {
```

```
  S[1] == {
```

```
    ClassName -> phi,
```

```
    ClassMembers -> {phi1,phi2},
```

```
    SelfConjugate -> False,
```

```
    Indices -> {Index[Scalar]},
```

```
    FlavorIndex -> Scalar,
```

```
    Mass -> {MS, 100}
```

```
  }
```

```
};
```

Symbol for the mass
used in the Lagrangian,
+ numerical value in GeV.

Particle Declaration

- There are many more (optional) properties for particle classes:
 - ➔ **Width**: Total width of the particle. 0 if stable.
 - ➔ **QuantumNumbers**: U(1) charges carried by the field.
 - ➔ **PDG**: PDG code of the particle (if existent).
 - ➔ **ParticleName/AntiParticleName**: A string, by which the particle will be referred to in the MC code.
 - ➔ **Unphysical**: If True, then the particle is tagged as not a mass eigenstate, and will not be output to the MC code.
 - ➔ Many more. See the FeynRules manual.

Parameter Declaration

- Parameter classes are defined in a similar way to the particle classes.
 - ➔ In our case, we have two parameters, the mass m and the coupling λ .
 - ➔ The mass was already defined with the particle, no need to define it a second time.

```
M$Parameters = {  
  lam == {  
    Value -> 0.1  
  }  
};
```

Parameter Declaration

- Parameters belong to two different classes, specified by the option **ParameterType**:

- ➔ **External**: Numerical input parameters of the model.
The **Value** must be a **real** floating point number.

Example:

$$\alpha_s = 0.118$$

- ➔ **Internal**: Dependent on other external and/or internal parameters. The **Value** can be a floating point number or an algebraic expression (in Mathematica syntax).

Example:

$$g_s = \sqrt{4\pi\alpha_s}$$

- By default every new parameter is **External**.

Parameter Declaration

- By default, all parameters are defined as real. It can be made complex by setting the `ComplexParameter` option to `True`.

Parameter Declaration

- By default, all parameters are defined as real. It can be made complex by setting the `ComplexParameter` option to `True`.
- Just like particles, parameters can carry `Indices`, i.e., they can be matrices
- It is possible to specify that a matrix is hermitian, etc.
 - ➔ `Hermitian`: `True/False`.
 - ➔ `Orthogonal`: `True/False`.
 - ➔ `Unitary`: `True/False`.

The *Mathematica* session

- We now run `FeynRules` to obtain the Feynman rules of the model
 - ➔ This is done in a *Mathematica* notebook.
- **Step 1:** Load `FeynRules` into *Mathematica*

```
In[1]:= $FeynRulesPath = SetDirectory["~/FeynRules-SVN/feynrules-current"];
```

```
In[2]:= << FeynRules`
```

The *Mathematica* session

```

The *Mathematica* session

- A selection of options for the `FeynmanRules` function:
 - ➔ `FlavorExpand`: List of all flavor indices that should be expanded. If `True`, then all flavor indices are expanded.
 - ➔ `ScreenOutput`: If `False`, the vertices are not printed on screen (useful for big models with 100's of vertices).
 - ➔ `SelectParticles`: Allows to only compute certain specific vertices.
 - ➔ `MaxParticles/MinParticles`: an integer, specifying the maximal/minimal number of particles that should appear in a vertex.
 - ➔ `Exclude4Scalars`: If `True`, rejects all four-scalar vertices (useful for big models with a plethora of phenomenologically irrelevant four-scalar interactions).

Getting Started: Gauging our model

Gauging phi⁴ theory

- Let us gauge our model, say the scalar is in the adjoint of SU(3) (QCD octet).
- The change in the Lagrangian is very minor:
 - ➔ add field strength tensor
 - ➔ replace derivative by covariant derivative.

$$\mathcal{L} = -\frac{1}{4}F_{\mu\nu}^a F_a^{\mu\nu} + D_\mu\phi_i^\dagger D^\mu\phi_i - m^2\phi_i^\dagger\phi_i + \lambda(\phi_i^\dagger\phi_i)^2$$

$$D_\mu = \partial_\mu - ig_s T^a G_\mu^a$$

- Technically speaking, we just added two new objects to our model:
 - ➔ a new particle: the gluon G .
 - ➔ a new parameter: the gauge coupling g_s .

Preamble of the model file

- The fields now carry an index in the adjoint index.
 - ➔ Need to define this new index in the preamble.

```
M$ModelName = "Phi_4_Theory_Octet";
```

```
M$Information = {Authors -> {"C. Duhr"},  
                 Version -> "1.0",  
                 Date -> "09. 09. 2011"};
```

```
IndexRange[ Index[Scalar] ] = Range[2];
```

```
IndexStyle[ Scalar, i];
```

```
IndexRange[ Index[Gluon] ] = Range[8];
```

```
IndexStyle[ Gluon, a];
```

Particle Declaration

- The scalar is now an octet.

```
M$ClassesDescription = {  
  S[1] == {  
    ClassName -> phi,  
    ClassMembers -> {phi1,phi2},  
    SelfConjugate -> False,  
    Indices -> {Index[Scalar], Index[Gluon]},  
    FlavorIndex -> Scalar,  
    Mass -> {MS, 100}  
  }  
};
```

Particle Declaration

- We also need to define the gluon field.

```
M$ClassesDescription = {  
  S[1] == {...},  
  
  V[1] == {  
    ClassName -> G,  
    SelfConjugate -> True,  
    Indices -> {Index[Gluon]},  
    Mass -> 0  
  }  
};
```

Parameter Declaration

- We also need to define the gauge coupling.

```
M$Parameters = {  
  lam == {  
    Value -> 0.1  
  },  
  
  gs == {  
    Value -> 1.22  
  }  
};
```

Gauge groups

- We have now defined the gauge coupling and the gauge boson.
- To gauge the theory we need however more:
 - ➔ Structure constants.
 - ➔ Representation matrices.
 - ➔ ...
- FeynRules allows to define gauge group classes in a similar way to particle and parameter classes.

Gauge groups

- FeynRules allows to define gauge group classes in a similar way to particle and parameter classes.

```
M$GaugeGroups = {  
  
  SU3C == {  
    Abelian -> False,  
    GaugeBoson -> G,  
    StructureConstant -> f,  
    CouplingConstant -> gs  
  }  
}
```

- Could add other representations via
Representation -> {T, Colour}

The Mathematica session

- Step 1: Load FeynRules into Mathematica
- Step 2: Load the model file
- Step 3: Enter the Lagrangian

$$\mathcal{L} = -\frac{1}{4} F_{\mu\nu}^a F_a^{\mu\nu} + D_\mu \phi_i^\dagger D^\mu \phi_i - m^2 \phi_i^\dagger \phi_i + \lambda (\phi_i^\dagger \phi_i)^2$$

```
In[9]:= L = -1 / 4 FS[G, mu, nu, a] FS[G, mu, nu, a] +
          DC[phibar[i, a], mu] DC[phi[i, a], mu] - MS^2 phibar[i, a] phi[i, a] +
          lam (phibar[i, a] phi[i, a]) (phibar[j, b] phi[j, b])
```

```
Out[9]= (∂mu(phii,a) - i gs Gmu,a phii,i) (∂mu(phii,a†) + i gs Gmu,a phii,i†) +
          lam phii,a phij,b phii,a† phij,b† - 1/4 (gs Gmu,bb Gnu,cc fa,bb,cc - ∂nu(Gmu,a) + ∂mu(Gnu,a))
          (gs Gmu,bb Gnu,cc fa,bb,cc - ∂nu(Gmu,a) + ∂mu(Gnu,a)) + MS^2 (-phii,a) phii,a†
```

Getting Started: Mixings

Mixings

- So far our model has the following form:

$$\mathcal{L} = D_\mu \phi_i^\dagger D^\mu \phi_i - m^2 \phi_i^\dagger \phi_i + \lambda (\phi_i^\dagger \phi_i)^2$$

Mixings

- So far our model has the following form:

$$\mathcal{L} = D_\mu \phi_i^\dagger D^\mu \phi_i - m^2 \phi_i^\dagger \phi_i + \lambda (\phi_i^\dagger \phi_i)^2$$

- In many BSM models the new fields are not mass eigenstates, but they mix, e.g.

$$\mathcal{L} = D_\mu \phi_i^\dagger D^\mu \phi_i - m^2 \phi_i^\dagger \phi_i - m_{12}^2 (\phi_1^\dagger \phi_2 + \phi_2^\dagger \phi_1) + \lambda (\phi_i^\dagger \phi_i)^2$$

- The gauge and mass eigenstates are then related via some unitary rotation,

$$\begin{pmatrix} \phi_1 \\ \phi_2 \end{pmatrix} = U \begin{pmatrix} \Phi_1 \\ \Phi_2 \end{pmatrix}$$

Mixings

- FeynRules offers the possibility to write the Lagrangian in terms of the gauge eigenstates, and let Mathematica perform the rotation.
- **N.B.:** Right now FeynRules **does not** diagonalize the mass matrix for you! The diagonalization has to be performed by the user.
- For small mixing matrices, this can simply be done in Mathematica.
- For larger matrices, need to use some external numerical code.

Mixings

- The mixing matrix is declared as a parameter:

```
M$Parameter = {  
  ...  
  
  UU == {  
    ComplexParameter -> True,  
    Unitary -> True  
    Indices -> {Index[Scalar], Index[Scalar]},  
    Value -> { UU[1,1] -> ...,  
              UU[1,2] -> ...,  
              ...}  
  }  
  ...  
};
```

Mixings

- The mass eigenstates are declared as normal particles

```
M$ClassesDescription = {  
  ....  
  S[11] == {  
    ClassName      -> PP,  
    ClassMembers  -> {PP1,PP2},  
    SelfConjugate  -> False,  
    Indices        -> {Index[Scalar], Index[Gluon]},  
    FlavorIndex    -> Scalar,  
    Mass           -> {{MP1, ...}, {MP2, ...}}  
  }  
  ...  
};
```

Mixings

- The gauge eigenstates are declared in a similar way

```
M$ClassesDescription = {  
  S[1] == {  
    ClassName      -> phi,  
    ClassMembers  -> {phi1,phi2},  
    SelfConjugate  -> False,  
    Indices        -> {Index[Scalar], Index[Gluon]},  
    FlavorIndex    -> Scalar,  
    Mass          -> {MS, 100}  
    Unphysical     -> True,  
    Definitions    -> {phi[i_, a_] :=> Module[{j}, UU[i,j] PP[j,a]]}  
  }  
};
```

Extending existing implementations

Extending the SM

- So far we have only considered our model standalone.
- For LHC phenomenology, one usually wants a BSM model that is an extension of the SM.
- FeynRules offers the possibility to start from the SM model, and to add/change/remove particles and operators.
- For this, it is enough to load our new model together with the SM implementation:

```
LoadModel[ "SM.fr", "Phi_4_Gauged" ];
```

- Note that the 'parent model' should always be loaded first in order to ensure that everything is set up correctly.

N.B.: In the SM implementation, the gluon and the QCD gauge group are already defined, so no need to redefine them.

Other available models

- The same procedure can be used to extend any other models.
- Many models can be downloaded from the FeynRules web page, and can serve as a start to implement new models (<http://feynrules.irmp.ucl.ac.be/>).
 - ➔ SM (+ extensions: 4th generation, diquarks, See-saw...).
 - ➔ MSSM, NMSSM, RPV-MSSM, MRSSM.
 - ➔ Extra dimensions: UED, LED, Higgsless, HEIDI.
 - ➔ Minimal walking Technicolor.

Towards LHC phenomenology: The UFO interface

From FeynRules to MadGraph

- The FeynRules interface for MadGraph is the so called UFO interface.
- The UFO interface can be called via
`WriteUFO[L];`
- Running the interface produces a set of text files that collectively go under name **UFO** (= **Universal FeynRules Output**).
- Using UFO's with MadGraph will be discussed in other lecture and the tutorials.

FeynRules MC conventions

- FeynRules itself does not make any assumption on the model, but its core is completely agnostic of any structure, like QCD, QED, etc.
- In order for the MC generator to function properly, they must be able to identify in each new model some standard information, like for example
 - ➔ Color and electric charges of particles.
 - ➔ Color structures of vertices.
 - ➔ Strong and weak coupling constant.
 - ➔ etc.
- Roughly speaking, each MC code needs the information on the SM parameters to be provided in a specific format.

FeynRules MC conventions

- As a consequence, even though the FeynRules core is completely agnostic, the SM parameters must be entered following specific conventions.

FeynRules MC conventions

- As a consequence, even though the FeynRules core is completely agnostic, the SM parameters must be entered following specific conventions.
- The SM gauge groups must be defined in the same way as in the SM implementation, e.g., for QCD,
 - ➔ Fundamental representation matrices: T
 - ➔ Structure constants: f
 - ➔ Strong coupling: g_S

FeynRules MC conventions

- As a consequence, even though the FeynRules core is completely agnostic, the SM parameters must be entered following specific conventions.
- The SM gauge groups must be defined in the same way as in the SM implementation, e.g., for QCD,
 - ➔ Fundamental representation matrices: T
 - ➔ Structure constants: f
 - ➔ Strong coupling: g_s
- The SM input parameters should correspond to the SMINPUTS of the SUSY Les Houches Accord:

$$M_Z, \alpha_s, \alpha_{EW}^{-1}, G_F$$

Summary

- Implementing a New Physics into a matrix element generator can be a tedious and error-prone task.
- FeynRules tries to remedy this situation by providing a Mathematica framework where a new model can be implemented starting directly from the Lagrangian.
- There are no restrictions on the model, except
 - ➔ Lorentz and gauge invariance
 - ➔ Locality
 - ➔ Spins: 0, 1/2, 1, 2, ghosts (3/2 to come in the future)
- Try it out on your favorite model!
