

An status update on the Swampland

Eduardo García-Valdecasas Tenreiro

22nd June 2020, Be.HEP Annual meeting

Université Libre de Bruxelles

Summer Solstice... And the Swampland

We will journey into the Swampland...

We will journey into the Swampland...

1. The Swamp...what?

- Why String Theory comes with a **Landscape of vacua**.
- Eft's outside of the Landscape lie in the **Swampland**.
- How to find your own conjecture.

We will journey into the Swampland...

1. The Swamp...what?
 - Why String Theory comes with a **Landscape of vacua**.
 - Eft's outside of the Landscape lie in the **Swampland**.
 - How to find your own conjecture.
2. Charting the Swampland: **A landscape of conjectures**.
→ A good map: (Palti, 2019)
3. Looking for a **unifying principle**.
4. **Phenomenological** applications: A new (provocative) framework?

From String Theory to our universe: The Landscape...

Put a String Theory on a CY_3 ...

	I	II	III		
mass	$\approx 2.3 \text{ MeV}/c^2$	$\approx 1.28 \text{ GeV}/c^2$	$173.1 \text{ GeV}/c^2$	0	$\approx 124.37 \text{ GeV}/c^2$
charge	2/3	2/3	2/3	0	0
spin	1/2	1/2	1/2	1	0
QUARKS	u up	c charm	t top	g gluon	H higgs
	d down	s strange	b bottom	γ photon	SCALAR BOSONS
LEPTONS	e electron	μ muon	τ tau	Z Z boson	
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	W W boson	
					GAUGE BOSONS VECTOR BOSONS
					HYPOTHETICAL TENSOR BOSONS
					G graviton

...And get a Universe

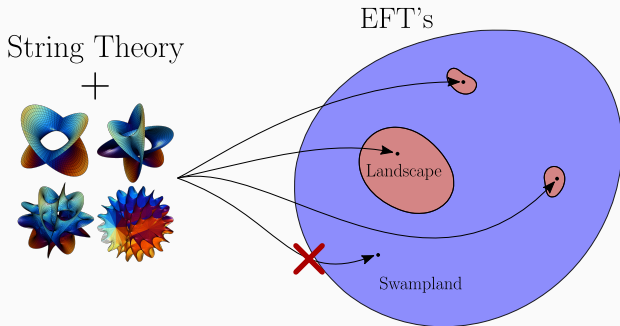

In fact a whole **Landscape** of Universes

...And the Swampland

- Can we get **any universe**? (a.k.a. any (EFT)) \Rightarrow **NO**

...And the Swampland

- Can we get **any universe?** (a.k.a. any (EFT)) \Rightarrow **NO**
- EFT's reachable from String Theory are in the **Landscape**. Anything else, in the **Swampland**.

- We want to chart the **boundaries**. One conjectures **criteria** to specify this boundary.

How to find your own Conjecture?

Evidence from Quantum Gravity (Global Symmetries)

A black hole (BH) argument (Banks & Dixon, 1988)

- Take theory with $U(1)$ global symmetry. An evaporating BH can't shed its charge!

- Global symmetries are inconsistent with no-hair theorem + Hawking evaporation.

An AdS/CFT Proof (Harlow & Ooguri, 2018)

- A global symmetry in the CFT is splittable. A local operator transforming under a global symmetry in the bulk can't be reconstructed from the boundary.

Global Symmetry

Gauge Symmetry

Evidence from String Theory (Global Symmetries)

- String Theory is the best understood theory of Quantum Gravity (QG). One can consider it an “**experimental**” arena for QG properties.
- **Caveat:** We might be looking under the **String Lamppost**.
- Remarkably, many “experimental” observations can be argued for using general QG arguments.
- **In String compactifications one finds:**
 1. All symmetries are gauged by the diffeomorphisms in compact dimensions.
 2. All representations of a gauge symmetry are realized.
 3. Gravity is weaker than other gauge forces.
 4. Non-SUSY stable vacua are, at best, extremely sparse.
 5. ...

Tom Rudelius

- Emergence
- Global Symmetries
- Anomalies inside dynamical objects of the theory
- ...

Global Symmetries are powerful!

- Absence of global symmetries is more powerful than meets the eye.
- Absence of **Generalized Global Symmetries** can be used to deduce many conjectures:
 1. **Completeness of spectrum** to explicitly break them. (Rudelius & Shao, 2020)

Global Symmetries are powerful!

- Absence of global symmetries is more powerful than meets the eye.
- Absence of **Generalized Global Symmetries** can be used to deduce many conjectures:
 1. **Completeness of spectrum** to explicitly break them. (Rudelius & Shao, 2020)

2. **Axioms** to gauge Chern-Weil Global Symmetries. $\theta \text{Tr}(F \wedge F)$ analog to $A_\mu J^\mu$. See Tom Rudelius talk at StringPheno 2020.

Global Symmetries are powerful!

- Absence of global symmetries is more powerful than meets the eye.
- Absence of **Generalized Global Symmetries** can be used to deduce many conjectures:
 1. **Completeness of spectrum** to explicitly break them. (Rudelius & Shao, 2020)

2. **Axioms** to gauge Chern-Weil Global Symmetries. $\theta \text{Tr}(F \wedge F)$ analog to $A_\mu J^\mu$. See Tom Rudelius talk at StringPheno 2020.
- Compactification with a non-trivial bordism can be thought as a global symmetry. All compactifications must be **trivial in bordism**. (McNamara & Vafa, 2019)

Some Interesting Conjectures for Pheno

A new (provocative) framework?

In phenomenology we assume the **Wilsonian framework**:

- SM unifies with Quantum Gravity at the Planck Scale.
- As we go down to an EFT, irrelevant operators decouple. The **UV decouples from the IR**.
- We can ignore Quantum Gravity effects at low energies.

The Swampland program says the opposite:

- **In Quantum Gravity UV and IR are connected.** E.g. Black Holes.
- Some EFT's may not be UV completed to Quantum Gravity.

No non-SUSY AdS vacua.

- In a consistent theory of Quantum Gravity there are **no stable non-SUSY AdS vacua**. (Ooguri & Vafa, 2017)
- EFT's belonging to the swampland must be consistent under deformations allowed by QG. In particular compactification.
- **Compactify the SM in a circle!** It turns out that it can give 3d (Non-SUSY) AdS depending on neutrino physics.
- For instance, **Majorana neutrinos** lead to AdS. They are **not allowed**.
- Lightest Dirac neutrinos must be light (Ibanez *et al.*, 2017; Hamada & Shiu, 2017):

$$m_\nu < 7.7\text{meV (NH)}, \quad m_\nu < 2.1\text{meV (IH)} \quad (1)$$

- A lower bound on the cosmological constant $\Lambda \gtrsim m_\nu^4$.

The Axion WGC

- An axion is an scalar field with a perturbative shift symmetry broken by a non-perturbative superpotential generated by e.g. instantons:

$$\mathcal{L} \in -f^2(d\phi)^2 + \Lambda^4 \sum_q e^{-qS}(1 - \cos(q\phi)) \quad (2)$$

- An axion is a scalar field with a perturbative shift symmetry broken by a non-perturbative superpotential generated by e.g. instantons:

$$\mathcal{L} \in -f^2(d\phi)^2 + \Lambda^4 \sum_q e^{-qS}(1 - \cos(q\phi)) \quad (2)$$

- **Axion WGC:** *An axion must couple to an instanton with action S s.t.*

$$\boxed{fS \leq M_p} \text{ (Arkani-Hamed } et al., 2007)$$

- For perturbative control: $S > 1$, which implies $f \leq M_p$.
- The bound on the periodicity of the axion limits its physical applications (**natural inflation, relaxion...**).

The Swampland Distance Conjecture

- As one moves in Moduli Space, a tower of states becomes exponentially light,

$$M_f < M_i e^{-\alpha \frac{d_{i,f}}{M_p}} \quad (3)$$

- This implies that, if one varies an scalar field, the EFT becomes inconsistent as the distance approaches the mass scale.
- The prototypical example is Kaluza-Klein compactification with strings.

$$M^2 = \left(\frac{n}{R}\right)^2 + \left(\frac{wR}{\alpha'}\right)^2$$

- It can be seen as a statement about the behaviour of asymptotic/singular regions in Moduli Space.
- Constraining whenever one has **large field displacements**.
- It can be used to constrain **light Stuckelberg fields**.(Reece, 2019)

The (Refined) DeSitter Conjecture

- There is a *controversial* claim that, any scalar potential would be required to satisfy:(Obied *et al.*, 2018; Ooguri *et al.*, 2018; Garg & Krishnan, 2018)

$$|\nabla V| \geq cV \quad \text{or} \quad \min(\nabla_i \nabla_j V) \leq -c'V \quad (4)$$

- A consequence of this statement is that **metastable DeSitter vacua**, satisfying,

$$\nabla V = 0, \quad \nabla^2 V < 0, \quad V > 0 \quad (5)$$

would **not be allowed in QG**.

- It has been used to argue for Quintessence, which is itself very difficult to achieve in QG.
- It may also have implications on Inflation. The precise implications have been studied in the literature.

Conclusions

- String Theory comes with a **Landscape of vacua**.
- We believe the Landscape is a tiny subset of the EFT's. Outside of it lies **the Swampland**.
- One characterizes the boundary of the Landscape **conjecturing features** of it.
- In the last years connections between the conjectures are appearing. Are there **underlying principles**?
- Quantum Gravity may affect non-trivially the IR. An opportunity for **QG phenomenology!**?
