March 2012

Amazing agreement in observable after observable!

But the model is VERY complicated for a “Fundamental Theory”

	Quarks
	Leptons
	Anti-Quarks
	Anti-Leptons
	Bosons

That's a lot of fundamental particles!
And, oddly, they form rows and columns
Flavor structure not explained!

Not the first time we've stumbled upon this problem!

Beams made from Reactors
and Particle Accelerators

They interact by the **weak** force

Interactions don't happen often!

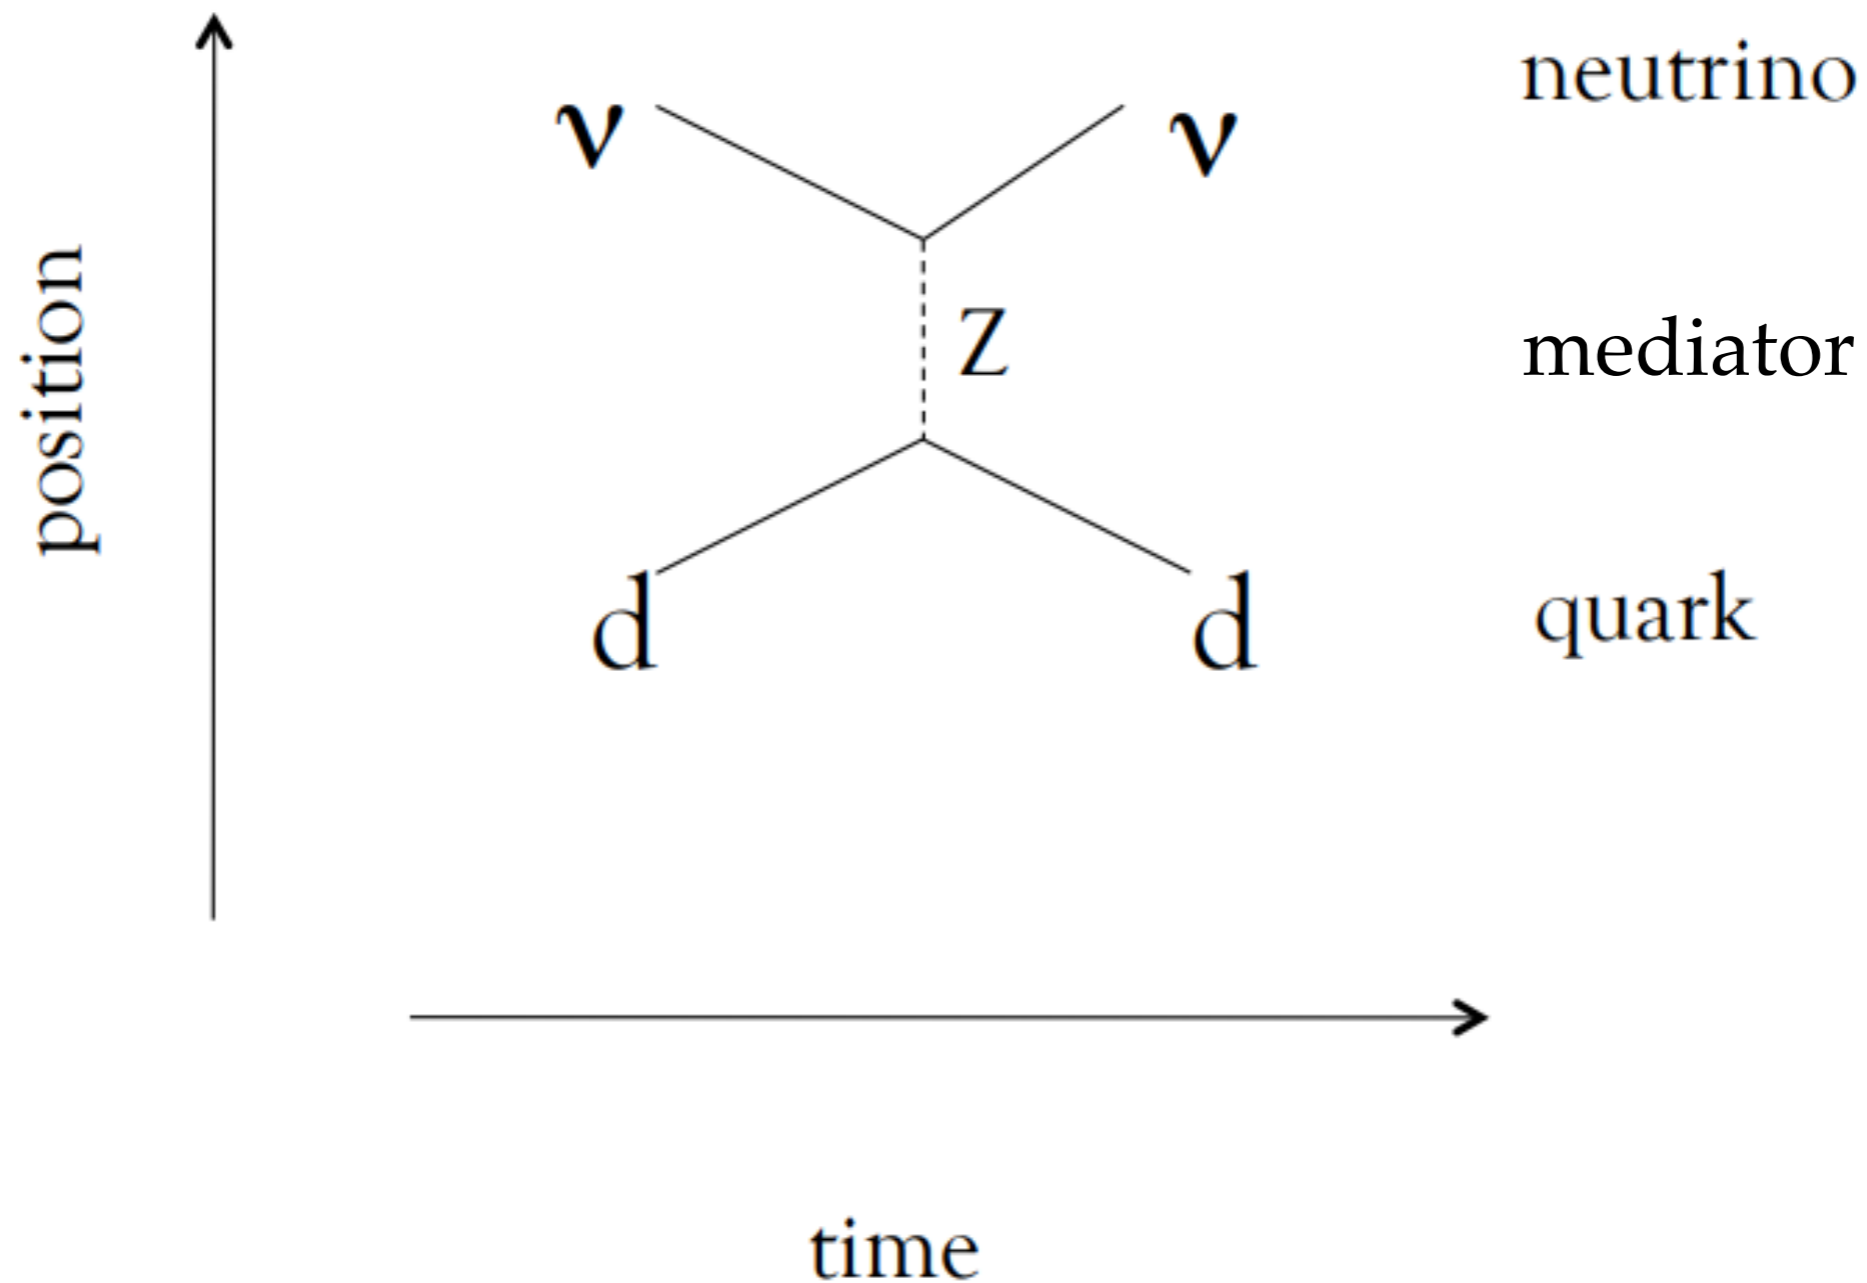

Solar neutrino cross section $\sim 10^{-43} \text{ cm}^2$

Compare to pp fixed target $\sim 10^{-24} \text{ cm}^2$

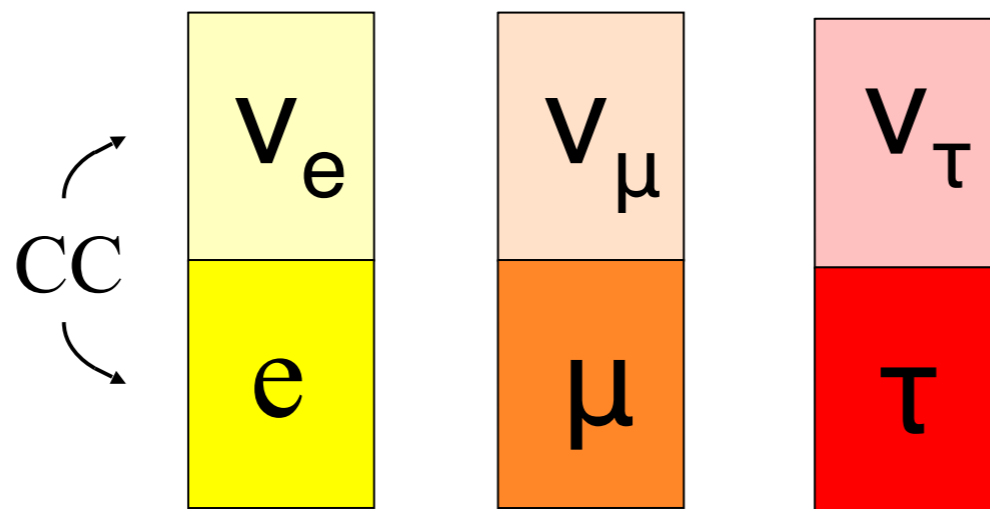

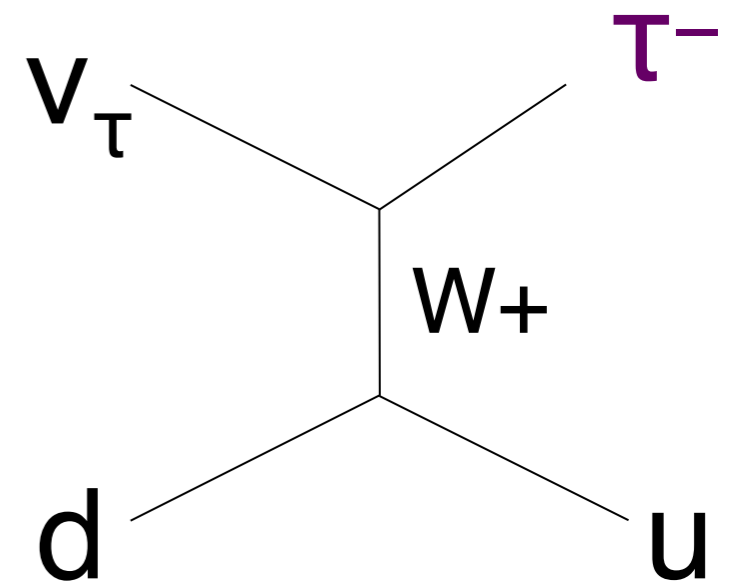

A neutrino has a good chance of travelling through
200 earths before interacting at all!

We describe interactions in terms of
“exchange particles”

We use the outgoing particle to classify the neutrino. We term this neutrino “flavor.”

Neutrino Oscillations Primer

In two generations, the neutrino survival oscillation probability is given by:

$$P(\nu_\alpha \rightarrow \nu_\alpha) = 1 - \sin^2(2\theta) \sin^2\left(\frac{1.27 \Delta m^2 L}{E}\right)$$

Probability that ν_μ has become ν_e
 Probability that ν_μ is still ν_μ

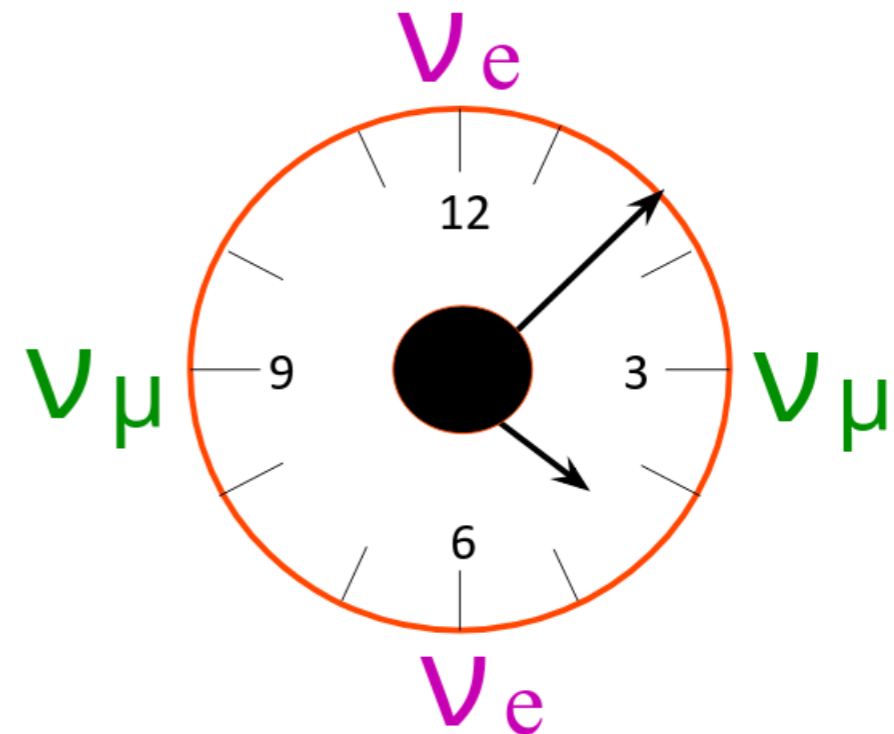

Neutrino Hamiltonian

← standard vacuum term →

$$H = \frac{m^2}{2p} = \frac{1}{2E} U \begin{pmatrix} 0 & 0 & 0 \\ 0 & \Delta m_{21}^2 & 0 \\ 0 & 0 & \Delta m_{31}^2 \end{pmatrix} U^\dagger$$

U: mixing matrix that relates mass to flavor

$$|\nu(t)\rangle = e^{-iHt/\hbar} |\nu_\alpha\rangle$$

To have a sense of time, neutrinos must have mass.

Fly's Eye 1991

300,000,000 TeV

ν and γ beams : heaven and earth

accelerator is powered by
large gravitational energy

**supermassive
black hole**

**nearby
radiation**

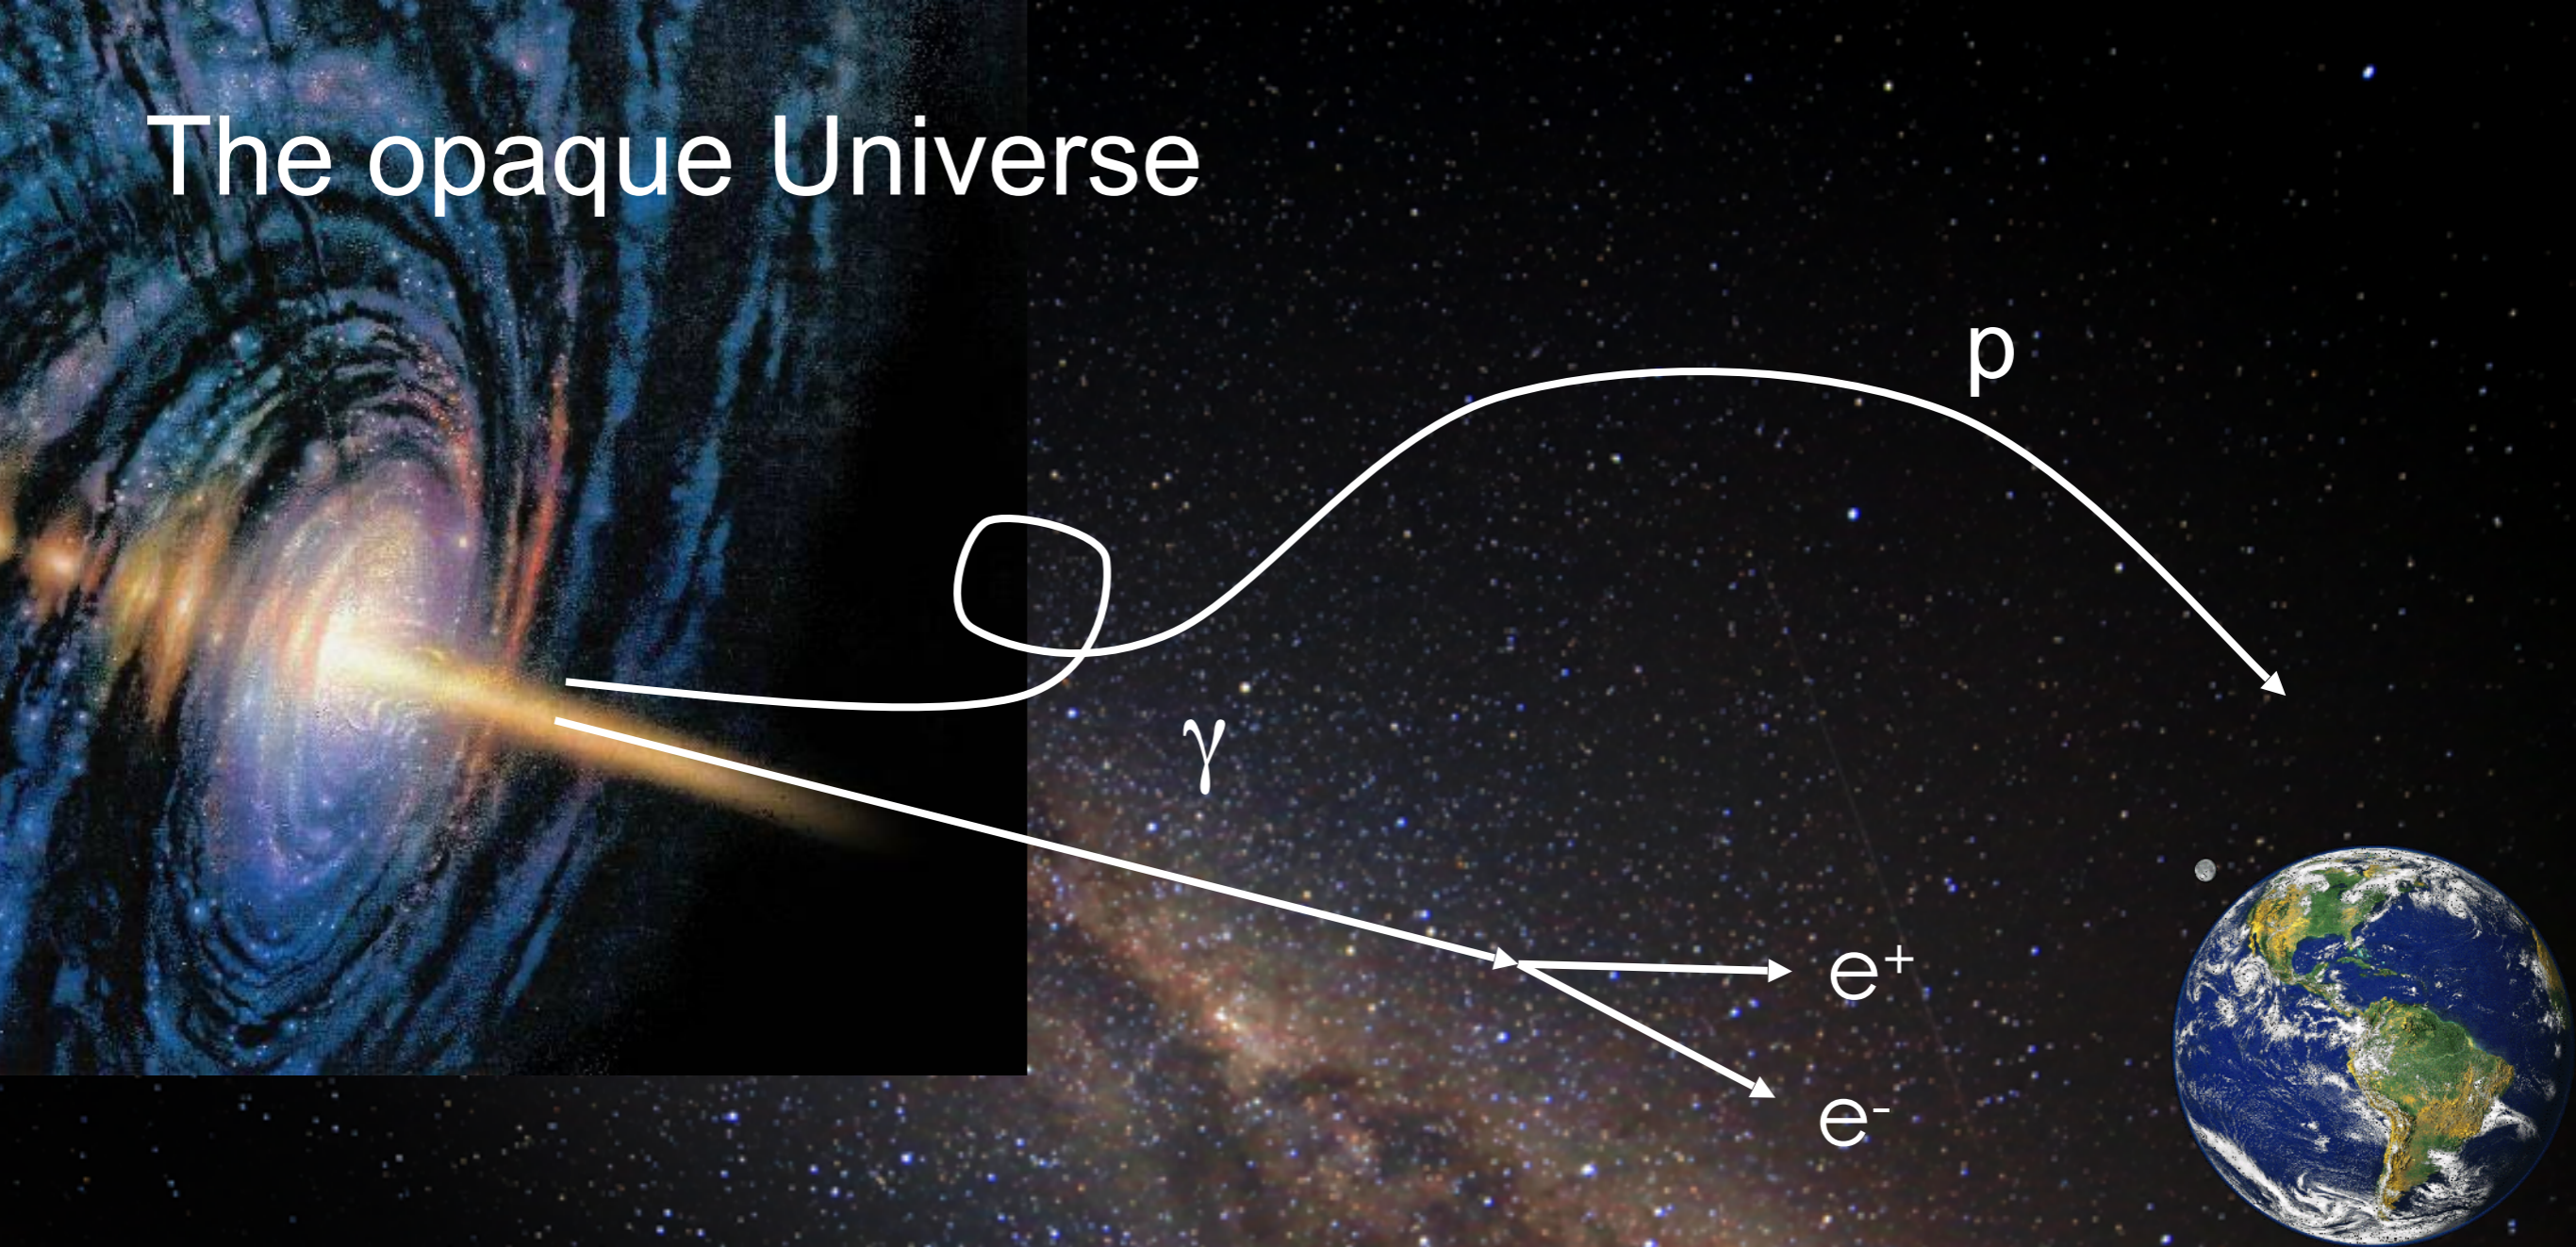

\sim cosmic ray + neutrino

\sim cosmic ray + gamma

The opaque Universe

PeV photons interact with microwave photons ($411/\text{cm}^3$)
before reaching our telescopes
enter: neutrinos

highest energy “radiation” from the Universe: neutrinos and cosmic rays

Universe is opaque above ~ 100 TeV energy

Neutrinos? Perfect Messenger

- electrically neutral
- essentially massless
- essentially unabsorbed
- tracks nuclear processes
- reveal the sources of cosmic rays
- ... but **difficult** to detect

Neutrinos in IceCube

IceCube

(to scale)

**Looking at it
from our point of view
here in the northern hemisphere:**

ICECUBE

SOUTH POLE NEUTRINO OBSERVATORY

Neutrinos from cosmic-ray air showers

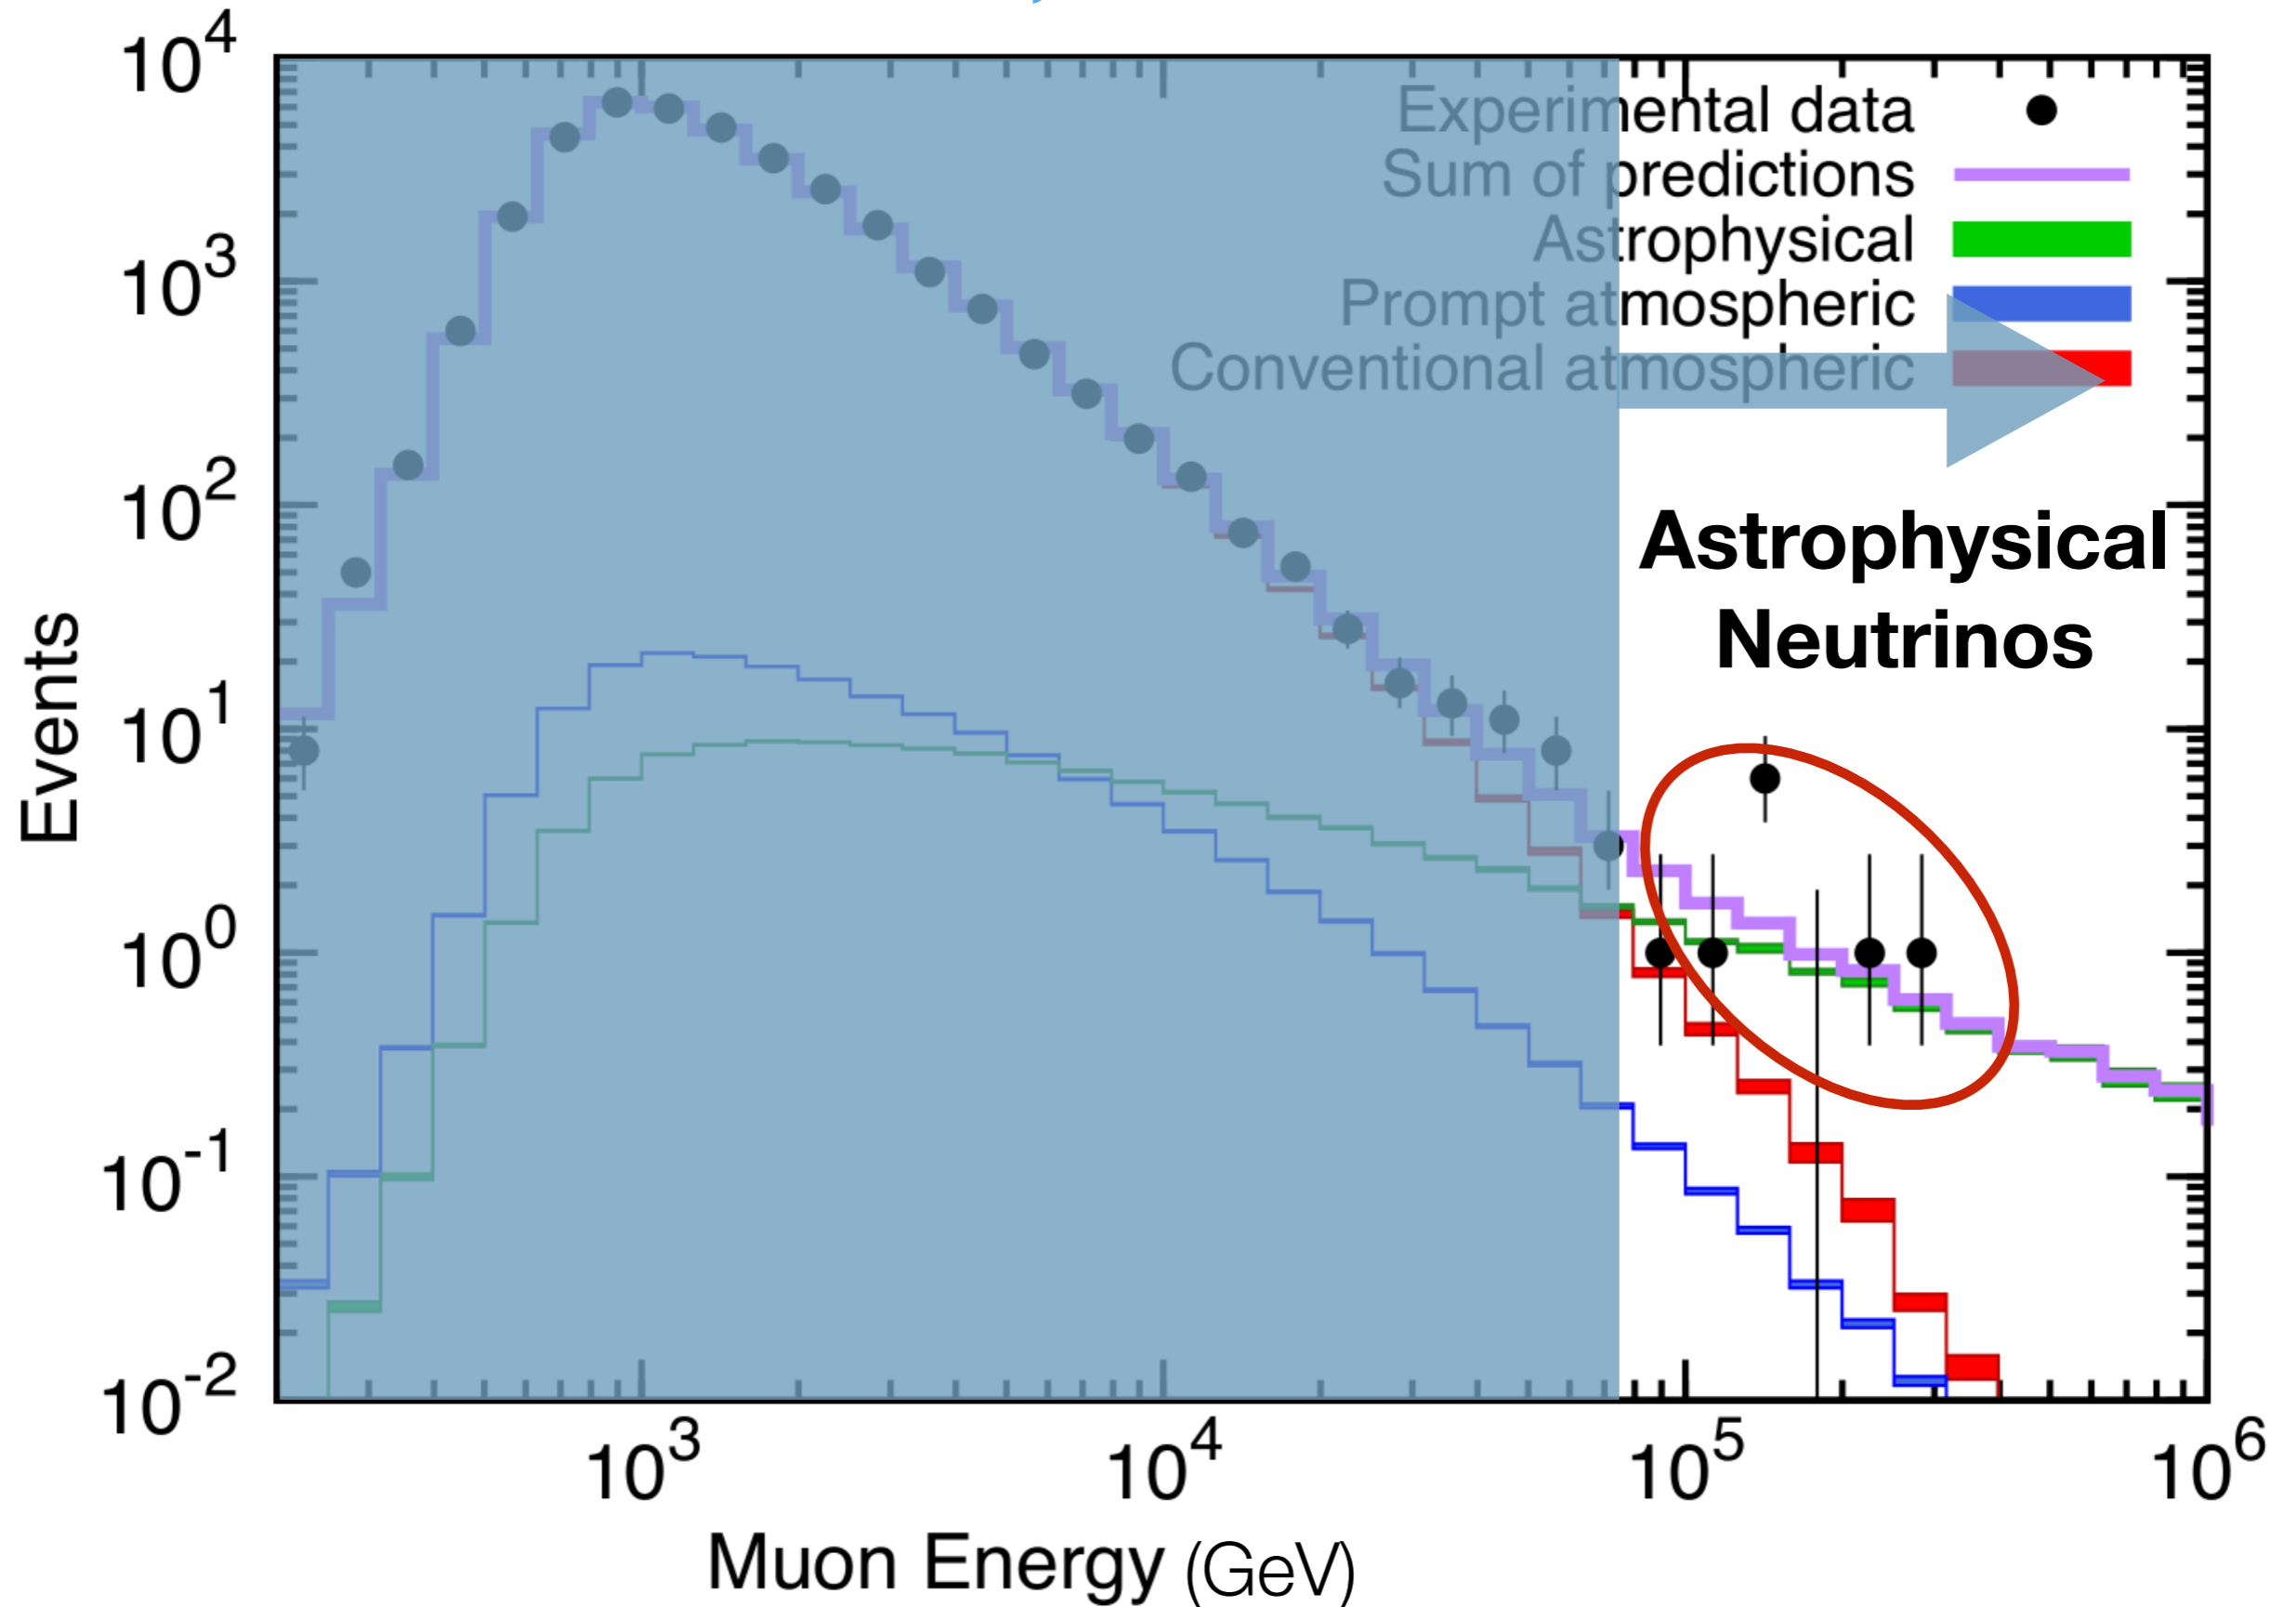

Atmospheric neutrinos come from all directions

IceCube observes a lot of atmospheric neutrinos!

But wait, there's more!

Neutrinos From Cosmic Beam dump

Blazar: TXS 0506+056

Multimessenger observations of a flaring blazar coincident with high-energy neutrino IceCube-170922A

The IceCube Collaboration, *Fermi*-LAT, MAGIC, *AGILE*, ASAS-SN, HAWC, H.E.S.S., *INTEGRAL*, Kanata, Kiso, Kapteyn, Liverpool Telescope, Subaru, *Swift*/*NuSTAR*, VERITAS, and VLA/17B-403 teams*†

Neutrino emission from the direction of the blazar TXS 0506+056 prior to the IceCube-170922A alert

Outline of the rest of this talk:

1. Neutrinos in general
2. Neutrinos as a cosmic messenger and in IceCube
3. Three strategies to find astrophysical neutrinos
4. Physics with a beam of a astrophysical neutrinos
 - Neutrino-Dark Matter Interactions
 - Neutrino interferometry in astrophysical baselines
5. The future

10 msec of IceCube data

Muons detected per year:

- Atmospheric $\mu \sim 10^{11}$ (3000 per second)
- Atmospheric* $\nu \rightarrow \mu \sim 10^5$ (1 every 6 minutes)
- Cosmic** $\nu \rightarrow \mu \sim 10^2$

Challenges:

Astrophysical neutrino flux is very small

Large atmospheric neutrino and muon backgrounds

Strategy One: look at the Northern Sky

Strategy:

- Use the Earth to block the large atmospheric muon flux
- Look at the highest energy where the atmospheric neutrino flux is smallest

Strategy Two: Use the outer detector as a veto

Strategy:

- Define a veto region in the detector to suppress the atmospheric background,
- Advantage: All-sky vision

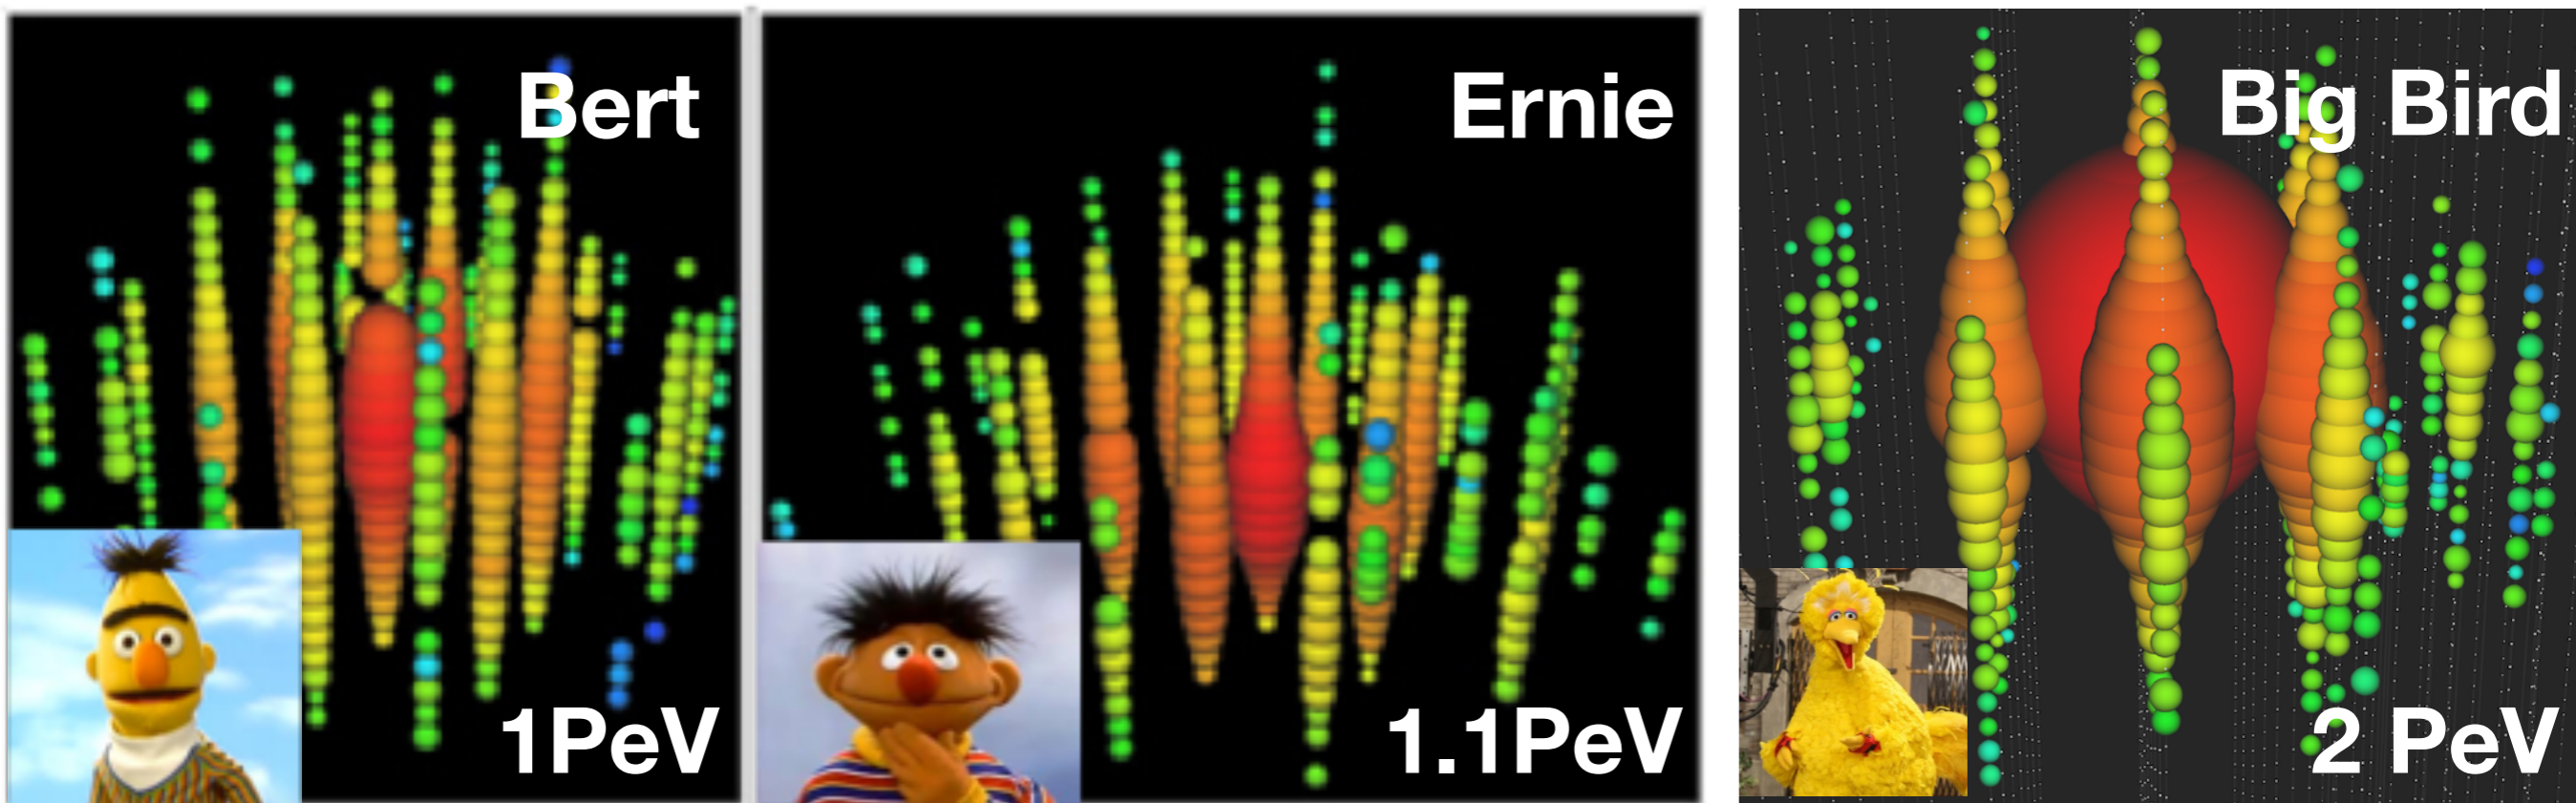

High-Energy Starting Events (HESE)

Large muon background is well-separated

Astrophysical neutrinos candidates!

This event selection contains some of the highest energy neutrinos ever observed

early  late

Color indicates time (red earlier, green later)
Sphere sizes indicate charge deposited.

Strategy Three: Find tau neutrinos

Most atmospheric neutrinos are mostly produced by either pion or kaon decay.

Tau neutrinos are predominantly produced by D-meson decay, which is a very small contribution.

Tau neutrino contribution negligible in energy range of interest.

Atmospheric neutrino source

Strategy:

Search for high-energy double cascade deposition

Strategy Three: Find tau neutrinos

Detecting anthropogenic tau neutrinos at neutrino experiments

DONUT: charmed mesons (no oscillation) and emulsion

DONUT Phys. Lett. B, [Volume 504, Issue 3](#), 12 April 2001, Pages 218-224

OPERA: oscillation (appearance from CNGS muon neutrino beam) and emulsion

OPERA Phys. Rev. Lett. 115, 121802 (2015)

$$\text{tau decay length} = \gamma c \tau = 50\text{m per PeV}$$

5. The future

Neutrino oscillations: natural interferometers

Neutrino oscillation is an interference experiment (cf. double slit experiment)

For double slit experiment, if path ν_1 and path ν_2 have different length, they have different phase rotations and it causes interference.

Neutrino oscillations: natural interferometers

Neutrino oscillation is an interference experiment (cf. double slit experiment)

If 2 neutrino Hamiltonian eigenstates, ν_1 and ν_2 , have different phase rotation, they cause quantum interference.

If ν_1 and ν_2 , have different mass, they have different velocity, so thus different phase rotation.

Neutrino oscillations: natural interferometers

Neutrino oscillation is an interference experiment (cf. double slit experiment)

If ν_1 and ν_2 interact with anything along their way, they will produce new oscillation features!

For example: long-range neutrino forces, dark matter-neutrino interactions, neutrino decay, Lorentz violation, etc ...

Dirac neutrinos ($M_R = 0$)

See-saw scenario $M_R \gg M_D$

Pseudo-Dirac $M_R \ll M_D$

$$M = \begin{pmatrix} 0_3 & M_D \\ M_D & M_R \end{pmatrix}$$

Neutrino Oscillations At Cosmic Scales

Neutrino Oscillations In Galactic Neutrinos?

spatial distribution $P(r, \ell, b = 0)$
of neutrinos which arrive at Earth

spatial distribution $P(r, \ell, b = 0)$
of neutrinos which arrive at Earth

pseudo-Dirac oscillations: $E = 1 \text{ TeV}, \delta m^2 = 10^{-13.5} \text{ eV}^2$

Pseudo-Dirac neutrinos can produce oscillations on
galactic neutrinos for mass-squared-differences around $10^{-13.5} \text{ eV}^2$!

Take away of astrophysical neutrino oscillations:

1. Cosmic neutrino oscillations are sensitive to extremely small mass differences.
2. IceCube astrophysical neutrinos allow physics-reach into the Planck scale.
3. We are beginning to enter territory of quantum gravity

Outline of the rest of this talk:

1. Neutrinos in general
2. Neutrinos as a cosmic messenger and in IceCube
3. Three strategies to find astrophysical neutrinos
4. Physics with a beam of a 1000 TeV neutrinos
 - Neutrino-Dark Matter Interactions
 - Neutrino interferometry in astrophysical baselines
5. The future

I hope I have convinced you that ...

Neutrino telescopes have great potential for discovery

Landscape of New Physics That We can Explore

Standard expectation:
Power-law energy spectrum

Standard expectation:
Isotropy (for diffuse flux)

See **CA**, Bustamante, Kheirandish, Palomares-Ruiz, Salvado, and Vincent arXiv:1907.08690 for more details

JEM-EUSO

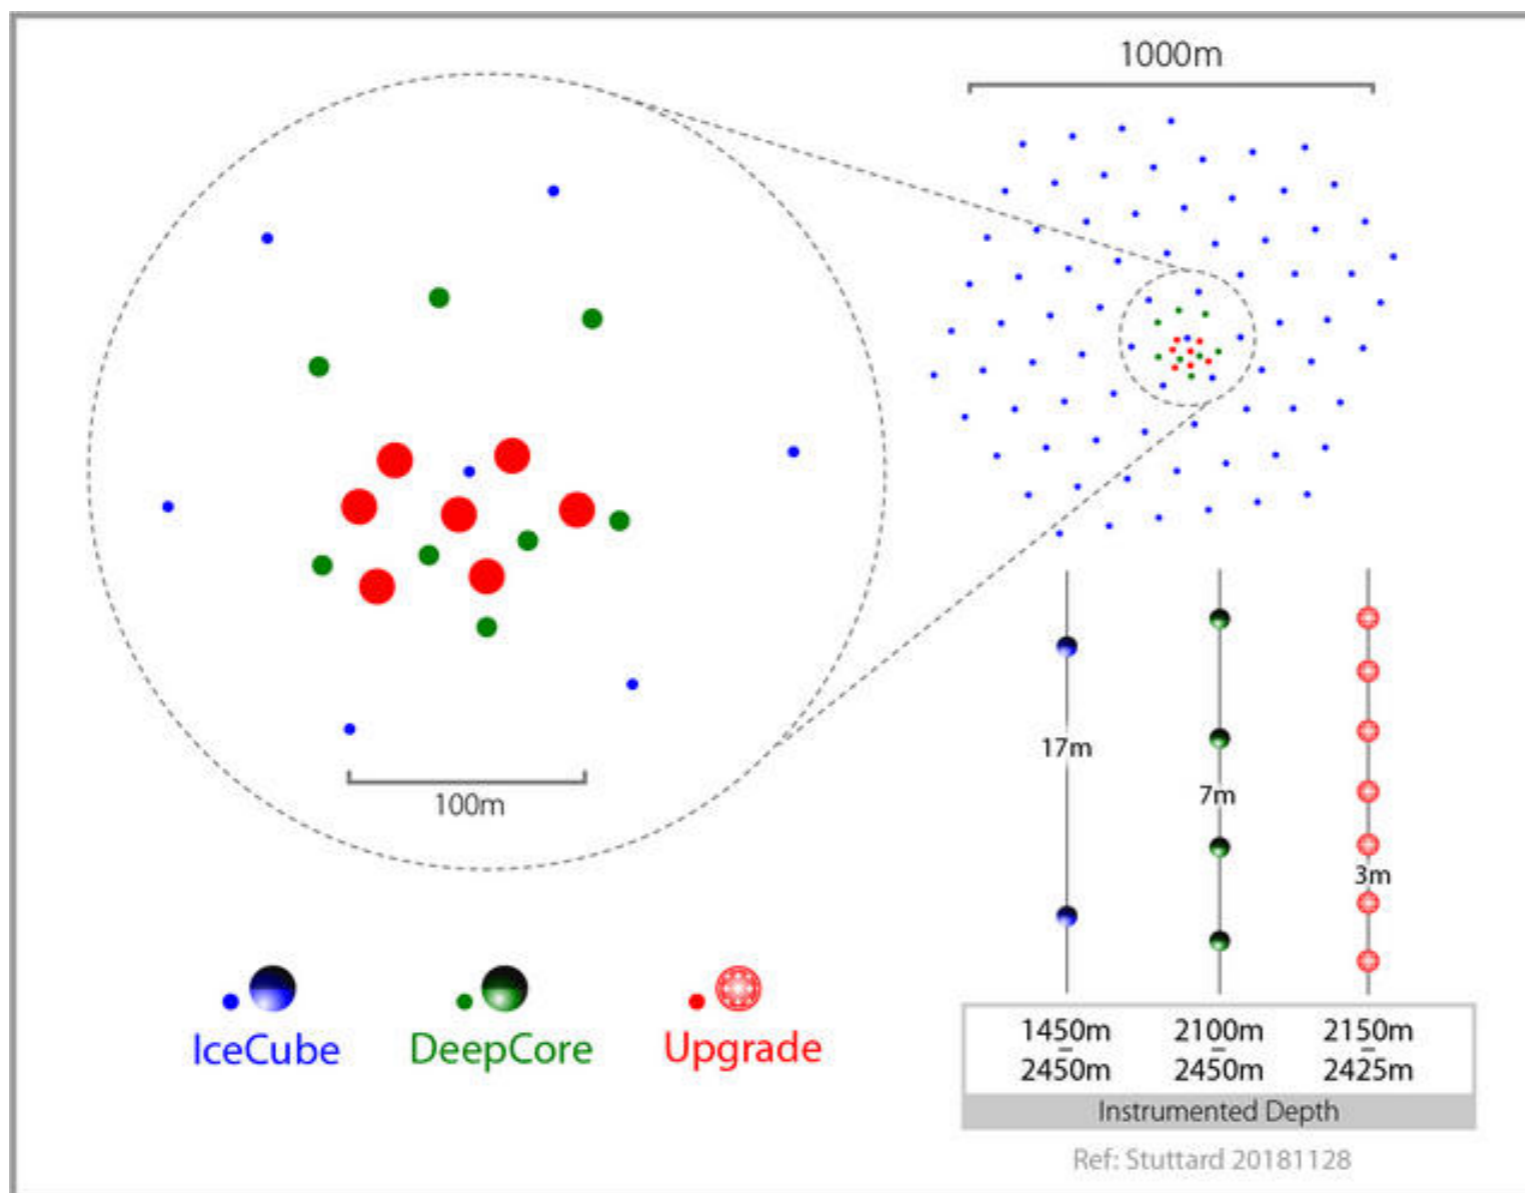

Many Neutrino Telescopes On Our Way

Non-exhaustive list

That potential is growing: The Upgrades

Phase 1: 7 new, high-precision strings in the central, densely instrumented region. Funded, installation in 2025.

New detector technologies.
Better low energy reconstruction.
Improved flavor identification.

Improved light-collection for low-energy events

*DeepCore (shown on the left) is the current low-energy extension of IceCube

That potential is growing: The Upgrades

Phase 2: x10 the volume of present IceCube, plus additional detectors.

TAMBO

TAU AIR-SHOWER MOUNTAIN-BASED OBSERVATORY (TAMBO) • COLCA VALLEY, PERU

P. Zhelnin, I. Safa, A. Romero-Wolf and CA ICHEP2022

*TAMBO means house or inn in Quechua.

We went to Peru earlier last year and found a location for the experiment!
First prototype detectors are expected to be deployed next summer.

**Neutrino astronomy has started with first high-significance sources.
Exponentially growing field expected.**

Conclusion

We live in exciting times for particle astrophysics

- First astrophysical neutrino sources are appearing.
- Diffuse neutrino measurements hint towards gamma-opaque sources.
- High-energy neutrinos give us a new way to search for dark matter.
- Neutrino interferometry is a powerful tool to measure tiny effects.

We also have great opportunities for the future

- With IceCube we have a rich data set for continuing searches
- With the Upgrade we will have great new precision
- More neutrino telescopes: more data!

May your physics be
BSM!

Thanks!

Projected Upgrade Flavor Measurement

New constraints on neutrino-dark matter interactions

Color scale is the maximum allowed coupling.

Cosmological bounds using Large Scale Structure from Escudero et al 2016

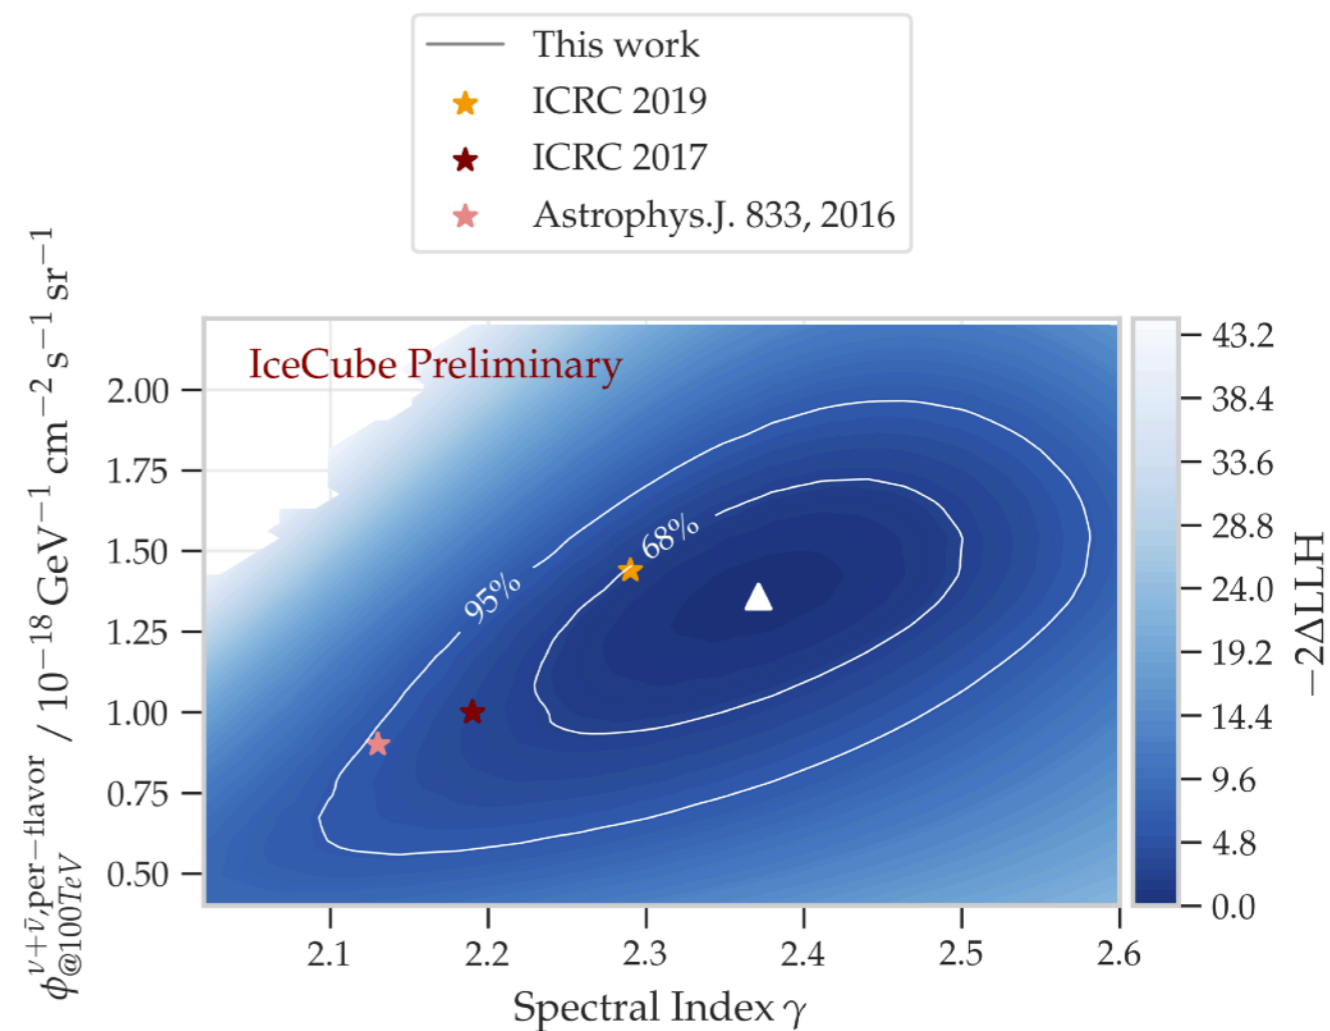

Diffuse astrophysical measurements

- Similar energy in the γ -rays, neutrinos and cosmic rays suggest common origin [Ahlers 2015, Murase+ 2014, Kowalski 2014]
- Pionic gamma rays associated with high-energy neutrinos cascade in EBL and contribute to IGRB below 100 GeV \rightarrow upper limit on neutrino spectrum.
 - Cosmic neutrino flux above 100 TeV saturates this limit.
 - Excess at lower energies suggest opaque sources

9.5 years of northern-sky neutrinos show consistent excess over atmospheric background

$$\gamma = 2.37 \pm 0.1$$

Starting Events Energy Distribution And Inferred Spectrum

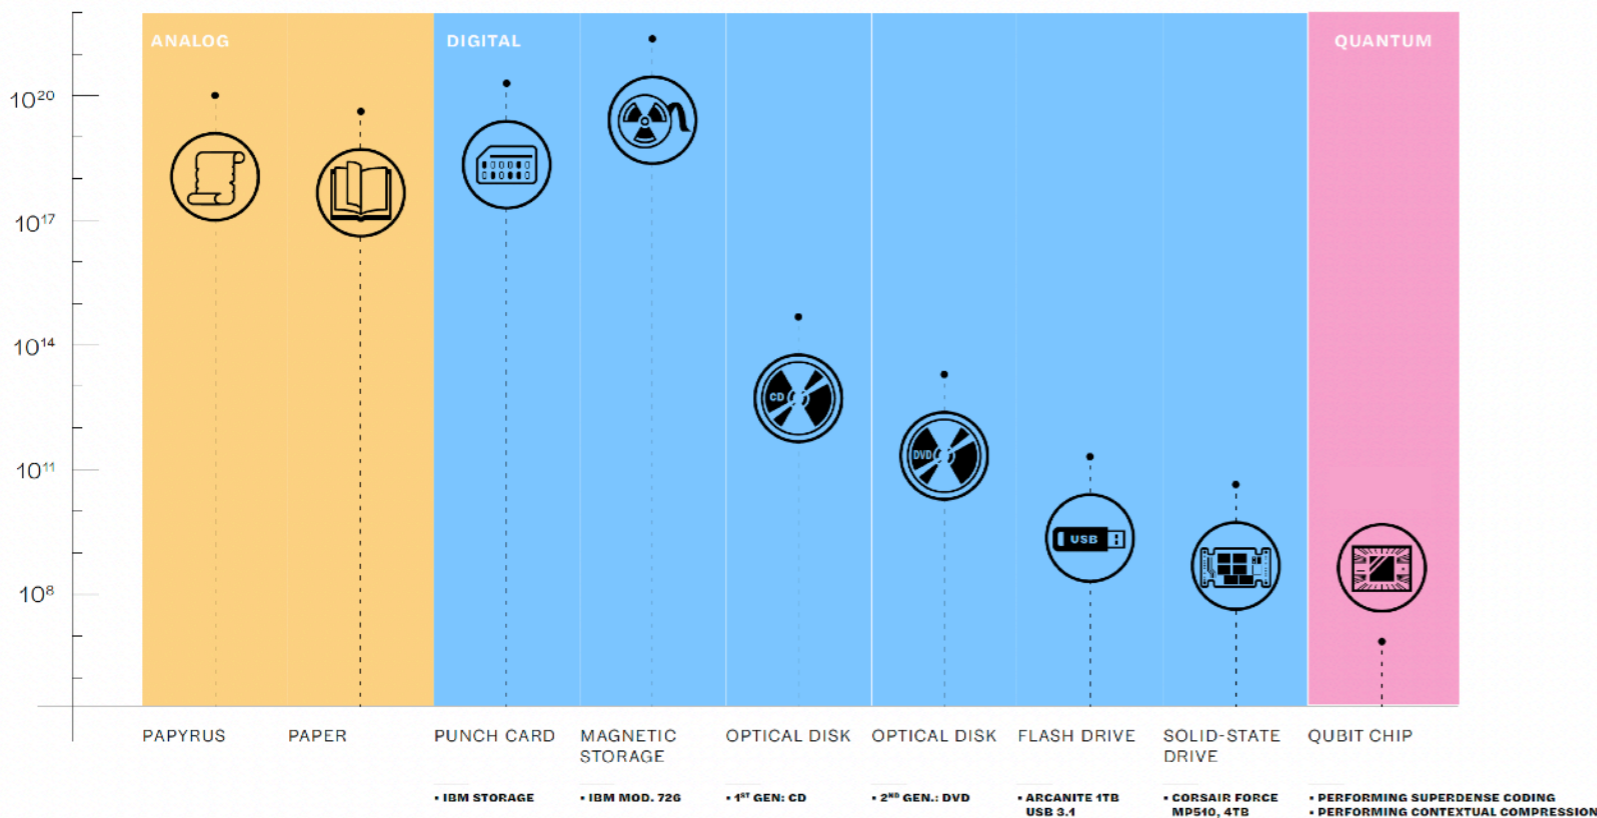

$$\gamma = 2.9 \pm 0.2$$

High-Energy Starting Events energy distribution is well described by a single power-law, but with a spectral index softer than the northern tracks!

Neutrino Telescopes In the Quantum Computer Era

ATOMS/BIT

Current number encoding e.g.:

```

Int32      00000000000000000000000000000101
UInt32     00000000000000000000000000000101
Float32    01000000101000000000000000000000
    
```

Quantum digital encoding:

Store the information in the correlation between spins (parity states):

bit	1	1	1	1	1	0	1	0	0
σ	XX	XY	XZ	YX	YY	YZ	ZX	ZY	ZZ
λ	-1	1	-1	1	-1	1	-1	1	-1

- Quantum encoding allows for compression (16qubits).
- Can store a typical IceCube event in 8 qubits and all google drive contents in 44 qubits.
- Protocol allows for contextual access to the data: can retrieve the relevant parts of information efficiently.

J. Lazar, S. Giner, G. Gatti, CA, and M. Sanz (2022) *in preparation*

Let's think how this technology will help us ten years down the road!

See [A. Delgado et al. 2203.08805](#) for recent review on Quantum Computing used in HEP data analysis.

Sources of Astrophysical Neutrinos

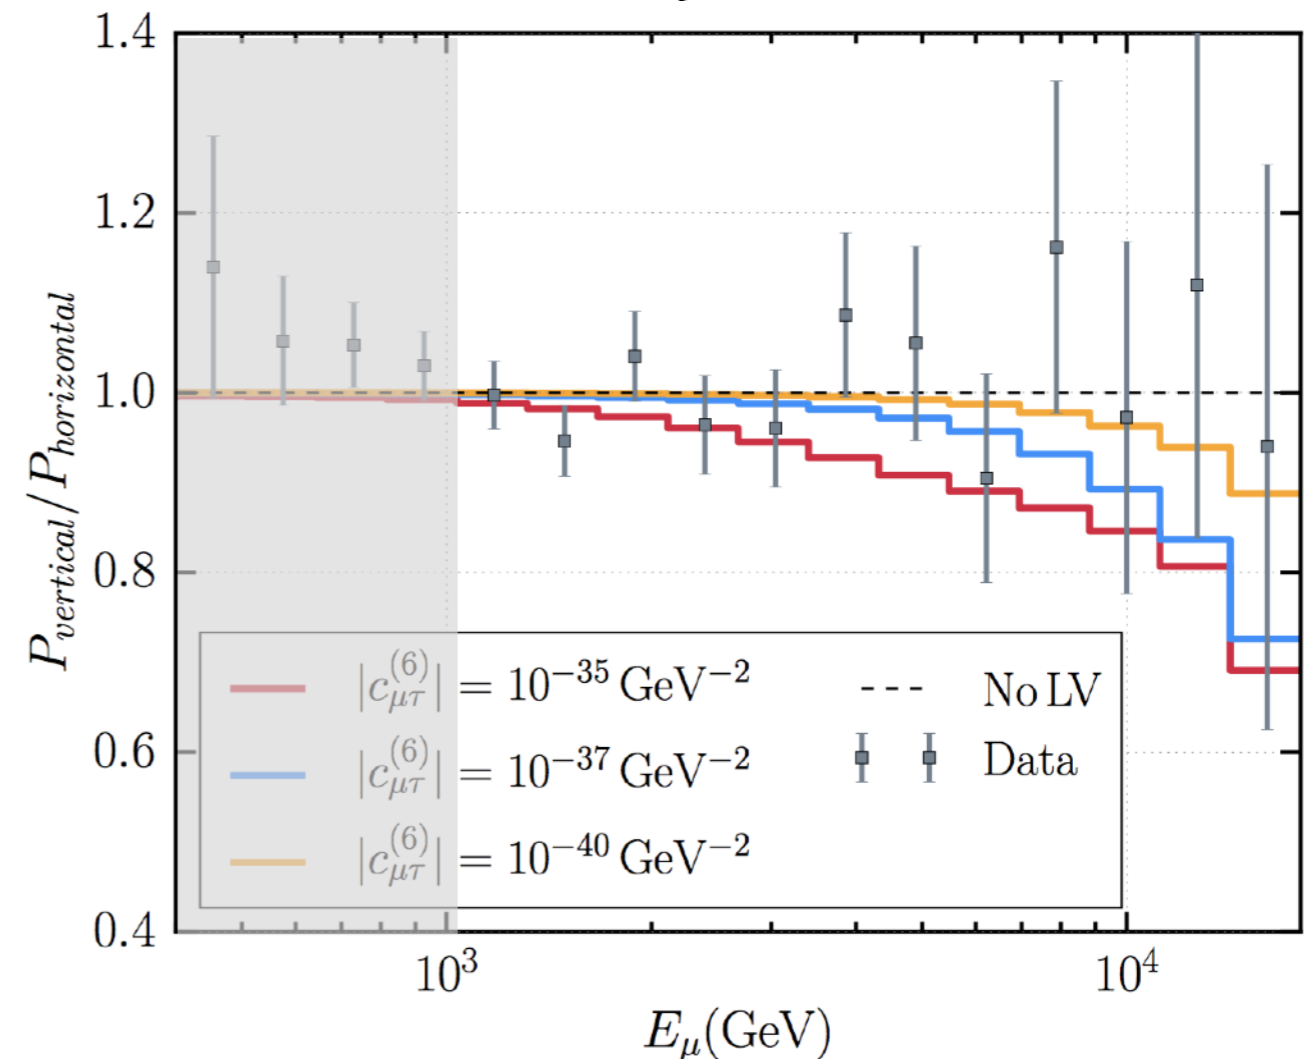

(arXiv:1007:00006)

Search for Lorentz Violation with High-energy Atmospheric Neutrinos

The analysis sensitivity, especially for high-dimensional operators, is dominated by the highest-energy events.

$$H \sim \frac{m^2}{2E} + \hat{a}^{(3)} - E \cdot \hat{c}^{(4)} + E^2 \cdot \hat{a}^{(5)} - E^3 \cdot \hat{c}^{(6)} \dots$$

$$P_{osc}(c_{\mu\tau}^{(6)} E_\nu L)$$

Lorentz violation changes the ratio of horizontal to vertical events.
