## Invited lecture 4 : Domino tilings of the Aztec diamond in random environment

*Wednesday 19 November 2025 16:30 (1 hour)*

It is well-known that under a certain choice of weights random domino tilings of the Aztec diamond can be analyzed via Schur measures on partitions. In this talk we will discuss the model in which the parameters of the Schur measure (or, equivalently, some weights of dominoes) are random themselves. We establish the limit shape and global fluctuations (quenched and annealed) via the technique of Schur generating functions.

**Presenter:** ZOGRAFOS, Panagiotis (University of Leipzig)
